Installation and Operation Manual

ATEM Mini

June 2020

English, 日本語, Français, Deutsch, Español, 中文,
한국어, Русский, Italiano, Português and Türkçe.

Welcome

Thank you for purchasing ATEM Mini for your live production streaming!

If you're new to live production switchers, then you're about to become involved in the most exciting part of the broadcast industry and that's live production! There is nothing like live production and it's so easy to become addicted to the adrenaline rush of editing in real time while the live event unfolds before your eyes.

ATEM Mini is a small live production switcher that automatically converts 720p and 1080p HD video and connects it directly to your computer via USB. The computer sees your ATEM Mini as a webcam so it can be streamed online using your favorite online streaming application like YouTube or OBS Studio.

ATEM Mini switchers use the same internal video processing used in the largest ATEM switchers, so even though the unit is small and portable, you get the same amazing level of control and professional features so it is very powerful. You can use the high quality buttons on the built in control panel, or launch ATEM Software Control and perform more complex switching. For example, you can manage all your graphics, set up keyers, record and run macros, and even mix and enhance your audio using a full audio mixer with faders and advanced EQ and dynamics controls.

ATEM Mini lets you start small, then expand your ATEM workflow as your projects grow. There really is no limit to what you can do! We hope you get years of use from ATEM Mini and have lots of fun with your live production!

This instruction manual should contain all the information you'll need for installing your ATEM Mini and getting started.

Please check the support page on our web site at www.blackmagicdesign.com for the latest version of the ATEM software. When downloading software, please register with your information so we can keep you updated when new software is released. We are constantly working on new features and improvements, so we would love to hear from you!

A handwritten signature in black ink that reads "Grant Petty". The signature is written in a cursive, flowing style.

Plugging in Video Sources

Plug your HDMI cameras and other HDMI sources into ATEM Mini's HDMI inputs. This gives you four different images to switch to when creating your program. Simply plug one end of the HDMI cable to your camera and the other end to any of ATEM Mini's HDMI inputs. The first input you plug in will set the video format, so if the first video source you plug in is 1080p50, all other inputs will automatically be converted to 1080p50.

If you want to set the video format yourself after plugging in all video sources, you can do that in the switcher settings in ATEM Software Control. You can find more information about changing the video format settings in the 'using ATEM Software Control' section.

Plug HDMI sources into ATEM Mini's four HDMI inputs

Plugging in a Monitor and Testing Inputs

With your video sources connected, you can now plug an HDMI television into ATEM Mini's HDMI output and check all the inputs are working. This is also a good opportunity to check sources and see if your shots are smoothly switching between each other.

To check your sources, simply press the numbered input buttons on ATEM Mini's control panel and watch the HDMI television. If your sources are working correctly, you should see them switch between each other when you press the input buttons.

Plug an HDMI television or monitor into ATEM Mini's HDMI output so you can monitor your program output and check all your sources are working properly

TIP ATEM Mini Pro has a powerful multiview feature that lets you see all your inputs, plus program and preview outputs simultaneously on one screen. The multiview is the default source for the HDMI output. This means once your ATEM Mini Pro is connected to an HDMI television you can see all your inputs at once and know they are all working straight away.

Connect a Microphone

When broadcasting a PowerPoint presentation or a kickstarter video, you might want to use a microphone so your voice can be heard loud and clear. Plug a microphone, for example a small wireless collar microphone, into one of the 3.5mm audio inputs.

If you are broadcasting an interview, plug the second microphone into the second 3.5mm audio input. You can even plug a music player into one of the audio inputs and mix it into your production.

Connect microphones to ATEM Mini's mic inputs

TIP While ATEM Mini will keep perfect audio and video synchronization, some cameras you connect might have some video processing delay. This can cause the audio on the ATEM Mini analog inputs to be slightly out of sync, because these inputs are not delayed like the camera's video is. So you can select some audio delay on the analog audio inputs to keep all your audio and video sources in perfect sync. For more information, refer to the 'delay control' section in this manual.

Connect your Computer

Plug ATEM Mini's webcam output into your computer's USB input. Now your computer will recognize ATEM Mini as a webcam so you can select it as the webcam source in your streaming program, such as Skype or OBS Studio.

Plug your computer into ATEM Mini's webcam out USB-C connector

TIP When recording to disk using ATEM Mini Pro, the USB connector will be busy recording to a disk so it won't be free to use as a webcam output. However the ATEM Mini Pro model also has live streaming direct via its Ethernet connection. If you want to use the USB connection to record to a disk you can use the Ethernet connection for streaming. You can even use the Ethernet for external control using ATEM Software Control. Please refer to the 'additional features on ATEM Mini Pro' section for more information.

Setting the Webcam Source

In most cases, your streaming software will automatically set ATEM Mini as the webcam, so when you launch your streaming software you will see the picture from your ATEM Mini straight away. If your software doesn't select ATEM Mini, simply set the software to use ATEM Mini as the webcam and microphone.

Below is an example of how to set the webcam settings on Skype.

- 1 In Skype's menu bar, open the 'audio and video settings'.
- 2 Click on the 'Camera' drop down menu and select Blackmagic Design from the list. You will see the video from ATEM Mini appear in the preview window.
- 3 Now go to the 'microphone' drop down menu and select Blackmagic Design as your audio source.

With your Skype settings set correctly, perhaps try out a Skype call with a friend as a quick test to check your broadcast setup is working.

That's all you need to do and ATEM Mini is now ready to broadcast your video to the world live!

Using Open Broadcaster

Open Broadcaster is another streaming platform that takes your program video and streams it live via your favourite video sharing application, like YouTube or Vimeo.

For information on how to set up Open Broadcaster with your ATEM Mini, refer to the 'Setting up Open Broadcaster' section in this manual.

Switching your Production

Now that you have your cameras and microphone connected and your streaming software sees ATEM Mini as a webcam, ATEM Mini is ready to start switching your production. This happens when you switch from one video source in your broadcast to another. A source can be any HDMI video signal connected to the HDMI inputs. It can also be a still graphic, a keyer, or any internal source like a color generator, color bars, or black.

With ATEM Mini, you can switch cleanly using professional cuts or transitions. For example, a cut will instantly change from one source to another and a transition will change sources over a defined duration often using an effect. For more information, refer to the 'using cuts and transitions' section later in this manual.

Using Cuts and Transitions

When switching video sources, you can use a straight cut which will immediately change one source to another, or a transition which gradually changes one source to another over a defined duration. Transitions appear as an effect, for example a cross dissolve or mix, a dip to colour, or even a stylized wipe and you have many styles to choose from.

Switching Sources using a Cut

In the demonstration below ATEM Mini will cut from input 1 to input 2.

To perform a cut:

- 1 Input 1 is illuminated red to indicate input 1 is currently live on air.
- 2 Select a 'cut' by pressing the 'cut' button. Pressing 'cut' tells ATEM Mini you want to use a straight cut instead of an auto transition.
- 3 Now press the input 2 button.

Input 1 will now immediately switch to input 2 and you will see input 2 illuminated red, which means input 2 is now live on air. This is known as a cut as you are 'cutting' directly from one source to another.

Switching Sources using an Auto Transition

Transitions let you smoothly switch from one source to another over a defined duration. For example, a mix transition gradually fades the current source into the next until the original source is no longer visible. A wipe transition will move a line across the original source revealing another effectively wiping across the image. You can add a colored border, or make it soft so the edge is smooth and pleasing. You can even use digital video effects or DVEs, such as a squeeze or push, to move the images as they transition from one to the other.

In the demonstration below ATEM Mini will switch from input 1 to input 2 using a mix transition:

To perform a mix auto transition:

- 1 Press the 'mix' button to select a mix transition.

- 2 Now press a duration you want for the mix.

- 3 Press the 'auto' button to tell ATEM Mini you want to use an automated transition.
- 4 Press the input 2 button to perform the mix transition.

You will now see inputs 1 and 2 buttons illuminated red while the transition happens and your broadcast changes to input 2. When the transition is complete, input 2 will be illuminated red to indicate it is now live on air.

Transition Styles and DVEs

The buttons above the 'auto' button contain different transition styles, including a mix cross dissolve and a dip to color.

You can also select horizontal and vertical wipe transitions by pressing their respective transition style buttons. These also include DVE push and squeeze transitions.

Press the transition type button for the transition you want to use, for example a horizontal or vertical wipe, push or squeeze DVE transition, and mix or dip transition

Controlling Audio

When setting up your production or during your broadcast, you will likely want to control audio levels if the sound is too quiet or too loud.

When an audio level is too loud it will clip. Clipping means the audio has increased beyond the maximum accepted level and when this happens it can distort and sound unpleasant.

Pressing the up and down arrow buttons for each input will increase or decrease the audio level for the respective source. For example, if the presenter's voice is too loud and risks clipping, you can decrease the audio level by pressing the down button incrementally until the level is safe.

ON OFF

Pressing the on or off buttons will let you permanently enable the audio from the respective input source, or turn its audio off completely.

ON – When the input's audio is set to 'on', the input audio will be heard permanently, even if the source is not currently on air.

OFF – When the input's audio is set to 'off', the source audio will never be heard even if the source video is on air.

AFV

AFV stands for 'audio follows video' and will let the audio for a respective input be heard whenever the source is switched on air.

To enable or disable AFV for each input, simply press its AFV button.

Reset

Pressing the 'reset' button will restore the input audio level to its default position. This is helpful if you want to cancel any adjustments or reference the original level before you made changes.

Using Picture in Picture

Picture in picture superimposes a second source over your broadcast video source in a small box you can position and customize. Input 1 is the default picture in picture source, so if you're broadcasting gameplay and want to superimpose your reactions, plug your camera into input 1 and it will appear in picture in picture.

To enable picture in picture:

- 1 Make sure your video to be inside the box is plugged into HDMI input 1.
- 2 Plug your main video into HDMI input 2, 3, or 4.
- 3 In the picture in picture buttons on control panel, press 'on'.

You will now see the picture in picture box appear on the screen. To select a different position, press any of the position buttons.

Using the Upstream Keyer

ATEM Mini's upstream keyer is used to superimpose graphics or blend one video layer over another using transparency. This means you can tell ATEM Mini to make an input source's background color invisible using the chroma keyer, or only use a specific section of a graphic using a luma or linear key. Linear keys are great for visual effects, titles and lower third graphics.

Press the 'key' on or off buttons to switch the upstream keyer on and off air

TIP ATEM Mini's advanced chroma keyer is perfect for keying graphics from a PowerPoint presentation. For example, you could have a series of graphics designed to be keyed over a background and these can be played out directly from a PowerPoint sequence. All you need to do is make any invisible areas green, or any solid color that isn't used in your graphic, then set the chroma keyer to make that color transparent. The images from your computer will be high quality over HDMI so will key very cleanly and look fantastic.

Fade to Black

The fade to black button is an easy way to start and end live broadcasts. Fade to black performs a mix to black which happens across all video layers at the same time. This means all video inputs, stills and any upstream or downstream keyers that are visible in your broadcast. When performing a fade to black, the master program audio will also fade out to silence.

Simply press the FTB button to perform the fade to black. The button will flash while enabled.

To fade up from black, simply press the FTB button again. This is a clean way of starting and finishing a broadcast.

Using a Still Graphic

The 'still' button is another input source you can switch to in your production. Simply press the 'still' button to switch a still loaded in the media player to air.

To take the graphic off air, simply switch to a different input source.

The 'still' button will switch a graphic loaded in ATEM Software Control's media pool. ATEM Software Control is an extremely powerful software control panel that opens a world of options and lets you do a lot more with ATEM Mini.

Additional Features on ATEM Mini Pro

ATEM Mini Pro has additional features that give you more options for your broadcast and even more ability to control your production directly from the unit without the need for a computer.

Dedicated buttons on the control panel let you switch sources to the HDMI output, start/stop streaming and start/stop recording.

With ATEM Mini Pro, you also have the choice of streaming via the webcam output or direct streaming via Ethernet. At any time, you can record your broadcast to an external disk via USB-C and use the dedicated record buttons on ATEM Mini Pro to start and stop recording.

One of the most exciting new features on ATEM Mini Pro is the multiview. This powerful feature displays a multiview on the HDMI video output that shows a comprehensive overview of your production. All 4 HDMI input sources, the program and preview outputs, plus important recording, streaming and audio status information is presented on one screen so you always know exactly what is happening during your broadcast!

This section describes all the additional features on ATEM Mini Pro and how to use them.

Stream Buttons

Streaming is built into the ATEM Mini Pro model, so you don't need to use any complicated software to get started. Just use the included ATEM Software Control to select what streaming service you intend to use and then enter in the streaming key. Once you have completed this setup, you can simply press On Air to go live! There is more information in the live streaming section of this manual.

The stream buttons labelled 'on air' and 'off' let you start and stop streaming directly from your ATEM Mini Pro

When your broadcast has finished, all you need to do is press the 'off' stream button and your stream is stopped. This means once you are set up and streaming, your ATEM Mini Pro is completely independent and you don't need to go back to your computer to stop and close your stream.

TIP After your streaming details are entered into the 'output' palette in ATEM Software Control, your streaming setup is now stored in your ATEM Mini Pro so you can start streaming again immediately, even after a power cycle. This makes it easy to stream a new broadcast without having to reset your streaming software every time.

On ATEM Mini Pro, it is actually easier and faster to stream via Ethernet. This lets you stream immediately via any internet connection on a computer or internet router, while simultaneously giving you the additional benefits of ATEM Software Control over the same connection.

For information on setting up streaming and control via Ethernet, refer to 'direct streaming and switcher control via Ethernet' later in this section.

Recording using the Record Buttons

ATEM Mini Pro lets you record your stream via its USB-C output using an external disk or flash drive. For example, you can connect a Blackmagic MultiDock 10G and record directly to an SSD. When the disk indicator above ATEM Mini Pro's record button illuminates green, press the record button and you are now recording your broadcast to disk. To stop recording, press the 'stop' button.

ATEM Software Control records your stream using H.264 compression with an optimized compression ratio to provide high quality video without large file sizes.

Press the record button, marked 'rec', to record your broadcast to an external drive or flash disk via USB-C

Disk Status Indicator

The disk status LED indicator lets you know the status of the recording media. For example, the indicator illuminates green if the current drive is formatted and ready to record and red while recording.

Indicators include:

Green	Formatted disk is detected and ready to record.
Red	Disk is recording.
Slowly flashing red	Low disk space.
Rapidly flashing red	Bad disk performance causing disk to skip frames.

NOTE To record to an external drive, you first need to format the disk. Refer to the 'preparing media for recording' section for more information.

Setting the HDMI Output using the Video Out Buttons

The video out buttons on the right side of your ATEM Mini Pro are used to switch sources to the HDMI output. The default output source is the multiview and you can read more about this powerful feature later in this section.

Press the video out buttons to switch a source to the HDMI output

To change the HDMI output source, press any of the video out buttons. For example you can select the HDMI inputs for isolated camera recordings, or select the program output or multiview. Compared to ATEM Mini, having the buttons built into ATEM Mini Pro means you can change the HDMI output directly from the unit itself!

NOTE If you want to switch camera 1 direct or preview to the HDMI output, these sources are available from the 'output' drop down menu in ATEM Software Control.

Direct Streaming and Switcher Control via Ethernet

ATEM Mini Pro's Ethernet connector lets you stream directly while simultaneously providing the added benefits of ATEM Software Control. You can learn more about this powerful control software in the 'using ATEM Software Control' section.

Plug into your internet router via Ethernet to stream directly

To set up your ATEM Mini Pro for software control and direct streaming:

- 1 Plug ATEM Mini Pro into your computer's spare Ethernet port. It may take a moment for DHCP to find ATEM Mini Pro and assign an IP address.
- 2 Launch ATEM Software Control.
- 3 You will see ATEM Mini Pro listed as a connected ATEM switcher on your network. Simply select ATEM Mini Pro from the list.
- 4 Click 'connect'.

ATEM Software Control will now appear with buttons and indicators illuminated. You can now operate your ATEM Mini Pro the same way you would via USB-C.

If your computer is connected to the internet, this also sets up your ATEM Mini Pro for direct streaming via your computer. Keep reading for details on how to set up a direct stream.

Direct Streaming by Sharing Your Computer Internet

With ATEM Software Control now connected to your ATEM Mini Pro, you can set up a direct stream via your computer's internet connection.

You can select which platform you want to use in ATEM Software Control and set all the relevant settings for your stream. If you are setting up a broadcast on your channel that you will regularly use, these settings will be stored in your ATEM Mini Pro and you can then plug into any internet connection at any time and broadcast directly from the unit.

This section includes how to configure settings for YouTube Studio and Twitch.

TIP As you're setting up your broadcast, it's worth loading a standby graphic into ATEM Software Control's media player and switching it to the program output so you can perform a quick test broadcast before actually going live.

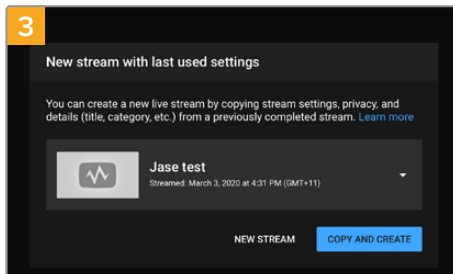

To configure your settings for YouTube Studio:

Log into your Youtube account. Click 'create'.

Click 'go live'.

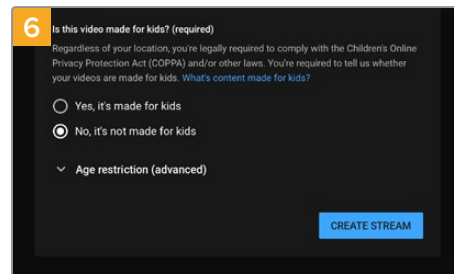

Click 'new stream', or if you have already streamed before, click 'copy and create'.

Enter your broadcast name and details. Set the broadcast to 'public' so anyone can watch.

Set the child protection to the appropriate setting.

Click 'create stream'.

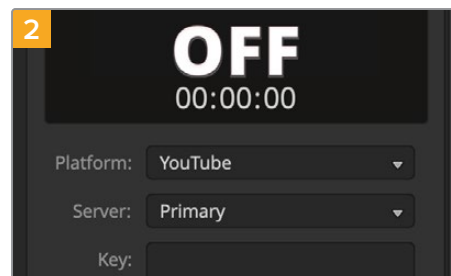

An auto generated stream key will appear in the stream settings, click 'copy' to copy the stream key.

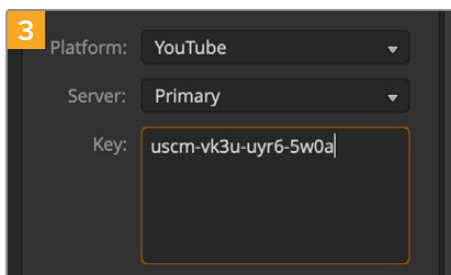

Now you have copied the stream key for your broadcast, you will need to paste it into the stream details in ATEM Software Control.

In ATEM Software Control's processing palettes, click on the 'output' tab. Open the 'live stream' palette.

Set the platform to YouTube by clicking in the menu and selecting YouTube from the drop down list. Set the server to 'primary'.

In the 'key' setting, paste the stream key you copied from YouTube.

Set the streaming quality to low, medium, or high. This will also set the quality for the recording output via USB-C.

With all the streaming details now set, it's worth performing a quick test broadcast to make sure everything is working. Press the 'on air' button on ATEM Mini Pro, or click on the on air button in the live stream palette.

YouTube Studio is now ready to start broadcasting. It may take a few moments for the memory buffer to initiate. When the buffering is complete, the 'go live' button will appear in the YouTube Studio manager and all you need to do is click 'go live'.

You are now broadcasting!

To test that everything is working properly, click the 'share' icon, copy the link and paste it into a new window or tab in your internet browser. You can now monitor your live stream just like a member of your audience.

When your production has finished, press the 'off' streaming button on ATEM Mini Pro to stop your broadcast.

To configure your settings for Twitch:

Log into your Twitch account. Click on your account avatar in the top right corner.

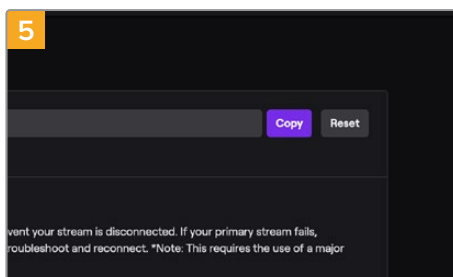

Click on 'creator dashboard'.

In the stream manager preferences, select 'channel'.

A primary stream key will be automatically generated.

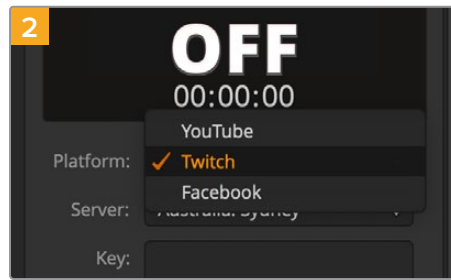

Click 'copy'.

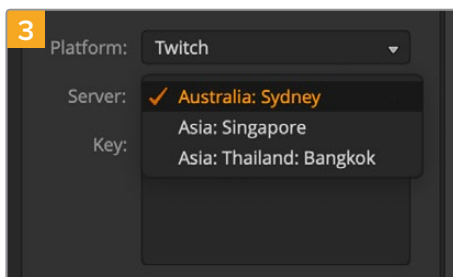

Now you have copied the stream key for your broadcast, you will need to paste it into the stream details in ATEM Software Control.

In ATEM Software Control's processing palettes, click on the 'output' tab. Open the 'live stream' palette.

Set the platform to Twitch by clicking in the menu and selecting Twitch from the drop down list.

Click on the 'server' setting drop down list and select the server nearest to your location.

In the 'key' setting, paste the stream key you copied from Twitch.

Set the streaming quality to low, medium, or high. This will also set the quality for the recording output via USB-C.

With all the streaming details now set, it's worth performing a quick test broadcast to make sure everything is working. Press the 'on air' button on ATEM Mini Pro, or click on the on air button in the live stream palette.

You are now on air! To check your broadcast, click on your account avatar and select 'back to Twitch'. Once in the main Twitch window, click your avatar icon again and select 'channel'. You will now see your broadcast on your channel and the live indicator will appear at the top of the window.

NOTE If you are using additional ATEM control panels with your ATEM Mini, then you might need a dedicated IP address. For more information, refer to the 'connecting to a network' section.

Using the Multiview on ATEM Mini Pro

The multiview is a powerful feature that lets you monitor the four HDMI inputs, together with the program and preview outputs as a group of views on one screen. The multiview also displays the media player, streaming status, disk recording disk status, audio levels, plus Fairlight EQ and dynamics indicators.

This feature provides a comprehensive overview so you will always know exactly what is happening with your broadcast!

The multiview is a powerful feature that lets you monitor all sources and outputs simultaneously

Below is a description of each view.

Preview

The preview view lets you monitor the source currently switched to the preview output. This view is helpful to practice switching between sources, previewing transitions or setting up a keyer so you can see what it will look like before switching to the program output. You need to change the switcher operation to program/preview style switching to make use of the preview view. There is more information about this in later sections of this manual.

Program View

The program view displays what is currently switched to the program output. This view will always show exactly what you are broadcasting.

Input Views

The input views display all the sources connected to the HDMI inputs. Having all four inputs on the multiview lets you see the image from every camera so you can make quick decisions. However they don't always have to be cameras as you could also have a computer's video output or a HyperDeck disk recorder connected to ATEM Mini Pro's inputs and you can monitor them in the input views.

When an input is switched to the preview or program output, a green or red tally border will appear around the input's respective view. Green represents the preview output and red represents the program output, or 'on air'.

Media Player View

This view displays the graphic currently loaded in the media player. To load a graphic, simply go to the media pool in ATEM Software Control and drag a still into the media player. You can read more about how to use the media player and the media pool in the section 'using ATEM Software Control/'using the media page'.

Streaming View

This view displays the streaming on air status, including the broadcast data rate and the cache status. You can also see what streaming platform you are currently broadcasting to as it is displayed at the bottom of the view.

- **On Air Indicator** Prior to recording, the on air status indicator will display 'off' to let you know ATEM Mini Pro is standing by and ready to broadcast. When streaming begins, the indicator will display a bright red 'on air' status until streaming is stopped.
If there is an interruption during the stream, for example the internet connection speed becomes too slow and the cache is depleted, the on air indicator will begin flashing.
- **Broadcast Data Rate** The data rate is measured in megabits per second. For ATEM Mini Pro to broadcast 1080p60 video without losing frames, the data rate needs to be approximately 5 to 7 Mb per second.

- **Cache Status** The cache status displays the capacity of ATEM Mini Pro's built in memory buffer. The cache is a small amount of internal memory that continuously records and plays the program output. It acts as a safety measure if the broadcast data rate decreases below a level able to sustain video. The variable nature of the internet is mostly due to network activity or wireless signal strength, so if the broadcast data rate decreases, the buffer data will increase accordingly. If the connection speed becomes slow enough that it cannot support the video stream, the cache will fill with video frames to compensate. However, once the cache is 100% full, the video stream will be compromised, so you will want to avoid a full cache where possible. You can do this by testing the connection speed when you set up your stream. During a broadcast test, watch the cache display in the multiview. If the cache frequently approaches 100%, choose a lower quality in the live stream settings.

Recording View

If you are recording to external drives via USB-C, this view will display the current recording status.

- **Recording Indicator** Prior to recording, or if there are no disks connected, the indicator will display 'stop'. When disks are connected, you will see them appear as icons below the indicator. When a disk is recording, the indicator displays 'rec' and will illuminate bright red.
- **Duration Counter** Underneath the recording indicator is the duration counter. When you press the record button on ATEM Mini Pro, the duration counter will start running.
- **Record Status Indicators** These indicators provide details on each drive and its recording status. For example, if you are using two drives, their drive names will be displayed along with available space and record time remaining. While a disk is recording, the indicator will illuminate red and shows how much disk space is left.

The disks are ordered by capacity. For example, if you have 4 SSDs connected via a Blackmagic MultiDock 10G, the drive with the largest remaining space will be labelled 1. Drive 2 will be the SSD with the next largest available space. When drives 1 and 2 are full, drive 3 will then assume the disk 1 indicator and disk 2 will become drive 4. You can always see what drives are assigned to the disk numbers by looking at the disk names underneath their icons.

Audio View

During your broadcast you can monitor the audio levels for each source and the levels of the program output using the audio view.

- **Audio Meters** Each input and the program output has its own audio meter and you can monitor them all simultaneously. If the audio level rises above -10dB the meter will illuminate red to warn you that it is close to the maximum strength of 0dB. Once the level reaches 0dB the audio will clip. Clipping means the audio will distort and you will need to decrease the level using ATEM Mini Pro's audio level buttons or the audio mixer in ATEM Software Control. You can read more about ATEM Software Control in the next section of this manual.

The audio meter is an important tool to monitor your levels so you can make sure your audio always sounds great!

- **Fairlight Icons** These icons let you know if EQ and dynamics controls are enabled in ATEM Software Control's audio page.

If the Fairlight icons are colored and illuminated, the EQ or dynamics tool is active and the input is on air.

If the icons are colored but dim, it means the tools are active, but the input is not on air.

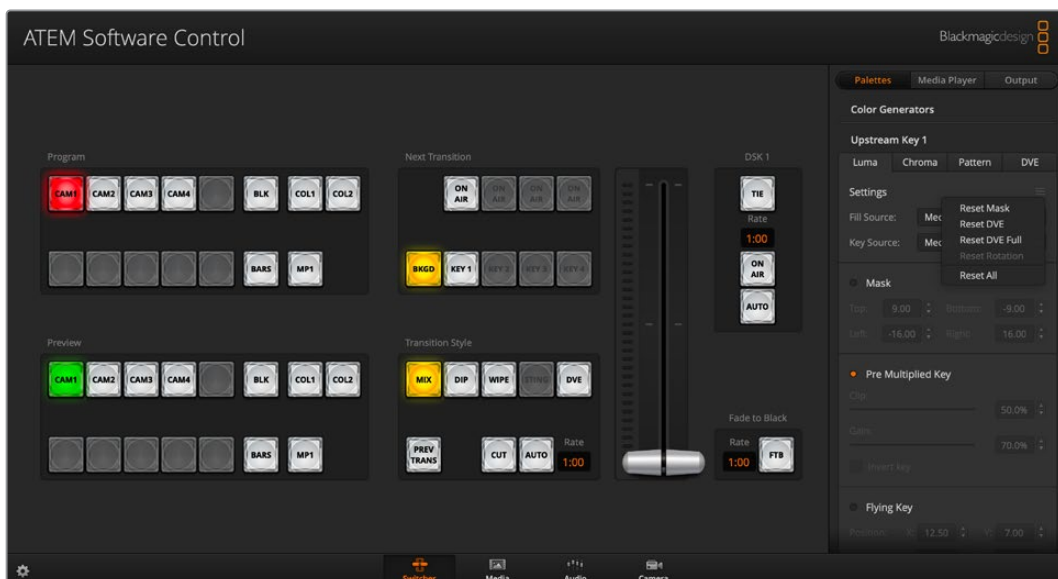

If the icons are dim and colorless, the tools are inactive or bypassed on the audio page.

The multiview is an excellent tool that will let you spot every detail and put you in the moment. For example, it can help you previsualize ideas in the preview window before switching them to the program output. You can monitor each HDMI source and test switching between them, set up a chroma key, or even preview a transition to see what it will look like before switching it to the program output!

ATEM Software Control

ATEM Software Control is a powerful software control panel that gives you a lot more control over your ATEM Mini. Once you start using ATEM Software Control you will quickly see just how much your ATEM Mini can actually do.

For example, you can manually perform transitions using the fader bar, select internal sources on the program and preview buttons, mix audio using a mixer with channel faders, set up keys, load graphics in the media pool and much, much more.

ATEM Software Control is included in the ATEM software installer and can be downloaded from the Blackmagic Design website. It's free and allows you to control your switcher in a similar way to a full hardware control panel. A range of palettes on the right side shows you all processing features of your ATEM Mini and allows settings to be easily made.

You can also use ATEM Software Control to configure your switcher settings. For more information on how to use ATEM Software Control, refer to 'using ATEM Software Control' in the following sections of the manual.

Switching Modes

'Cut bus' is the default switching mode which lets you change sources as soon as you press an input button. Setting ATEM Mini to 'program preview' mode lets you preview the source before switching it to air.

Cut Bus

In cut bus mode, as soon as you press an input button, it will immediately switch to air. This is a fast and easy way of switching.

In cut bus mode, pressing an input button will instantly switch it to air

Program Preview

In program preview mode, switching a source is a two step process. This is because pressing an input button puts the source in a preview state so you can decide whether you want to switch it, or perhaps select a different input source. This powerful switching mode is used by professional broadcast switchers across the world.

TIP If you connect an HDMI monitor, for example Blackmagic Video Assist, to ATEM Mini's HDMI output you can output the preview signal and monitor the selected input before switching it to air. For more information, refer to the 'setting the HDMI output source' section later in this manual.

In program preview switching mode, press an input button and then press the 'auto' or 'cut' button to switch the source to air

Using ATEM Software Control

ATEM Software Control has four main control windows: Switcher, Media, Audio and Camera. You can open these windows by clicking the three main buttons at the bottom of the interface or by pressing the Shift and left/right arrow hot keys. A general settings window can be opened by selecting the gear icon at the lower left of the interface.

Switcher Panel

When first launched, the switcher screen is selected, which is the main control interface for the switcher. ATEM Mini must be connected to your computer via USB for the software control panel to run.

Mouse or Trackpad Operation

The virtual buttons, sliders and fader bar on the software control panel are operated using your computer mouse or a trackpad if you're using a laptop.

To activate a button, click once with the left mouse button. To activate a slider, click and hold down the left mouse button while dragging. Similarly, to control the fader bar, click and hold down the left mouse button on the fader bar handle and drag up or down.

Media Manager

The media manager allows you to upload graphics to the media pool in ATEM Mini. Your ATEM Mini has memory for graphics that's called the media pool and holds up to 20 still graphics with alpha channel that can be assigned to a media player for use in your production.

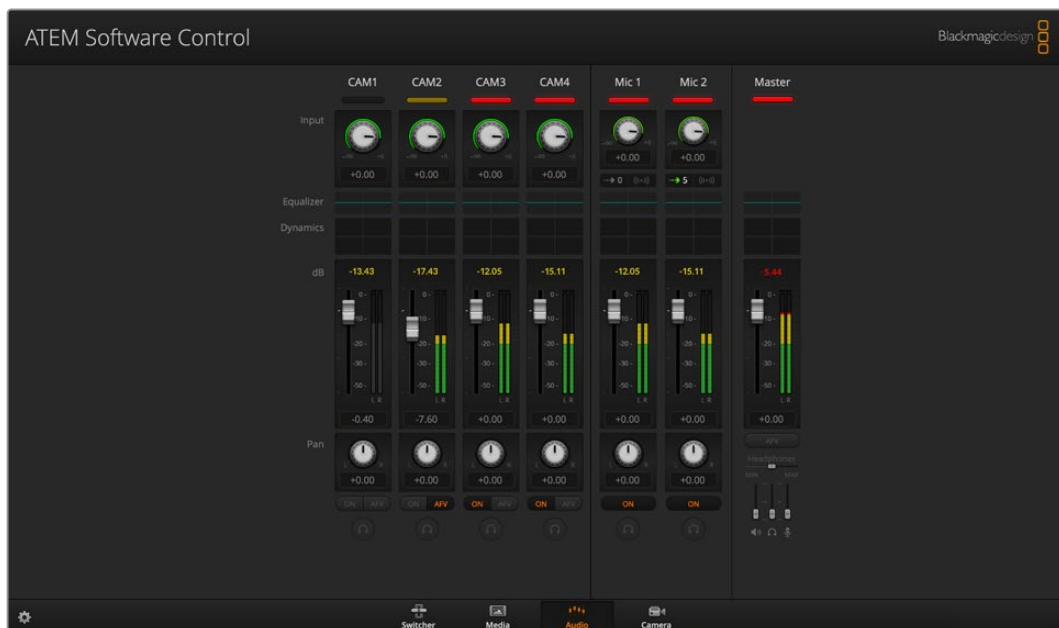

So, for example, you could have the maximum 20 still graphics loaded that will be used on your live production and then assign various stills to the media player as you work. As you take a graphic off air, you can change the media player graphic to the next graphic you want, and then you can put that media player back on air with the new graphic.

When a still is loaded into the media pool, the alpha channel is loaded automatically if one is included in the image. When a still is loaded into a media player, the output of the media player will include both key and fill outputs. If you select the media player as a key source, for example Media Player 1, both the fill and the key are automatically selected so you don't have to select them separately. However the key can still be routed separately so you can use a different key source if you wish. To learn more about keying, refer to the 'keying using ATEM Mini' section of this manual.

Audio Mixer

The audio tab in ATEM Software Control contains a powerful audio mixer interface which becomes active when controlling your ATEM switcher.

ATEM Mini includes a built in audio mixer that lets you use the embedded HDMI audio from your cameras, media servers and other inputs without the need for an external audio mixer. This is perfect when using your ATEM Mini on location or in small spaces within modern OB vehicles as you don't have to find room for an external audio mixer. The audio is mixed in the audio tab of ATEM Software Control and output via the USB webcam and Ethernet outputs. You can also route the program output via HDMI if you want to record your broadcast.

Your ATEM Mini also features built in mic inputs for mixing external audio.

If you prefer to use an external audio mixer, it's easy to disable the audio for all inputs and you only need to leave the external audio active in the audio mixer interface. More information on how to use the audio mixer is included in the next sections.

Camera Control

ATEM Mini can control Blackmagic Pocket Cinema Camera 4K and 6K models when updated to the latest software and plugged in via the HDMI inputs. Click on the 'camera' tab to open the camera control page. This is where you can control your HDMI camera settings such as iris, gain, focus, detail and zoom control on compatible lenses. Plus you can color balance cameras and create unique looks using the DaVinci Resolve primary color corrector that is built into Blackmagic Pocket Cinema Camera 4K and 6K.

For detailed information on how to use the powerful camera control features, refer to 'Using Camera Control' later in this section.

Camera control lets you control Blackmagic Pocket Cinema Camera 4K and 6K with ATEM Mini

Using the Software Control Panel

The switcher window is the main control interface for the switcher. During live production, the switcher window can be used to select sources and take them to air.

You can select the transition style, manage upstream/downstream keyers and turn on/off the fade to black. The palettes on the right hand side of the interface are where you adjust transition settings including transition rates, adjust color generators, control the media player, and adjust the upstream and downstream keyer as well as control fade to black rate.

Mix Effects

The Mix Effects block of the switcher tab contains all the source select buttons for the program and preview buses, allowing external inputs or internal sources to be selected for next transition previewing or switching to air.

ATEM mix effects

Program Bus Source Select Buttons

The program bus source select buttons are used to hot switch background sources to the program output. The source currently on air is indicated by a button that is illuminated red.

Preview Bus Source Select Buttons

In program preview switching mode, the preview bus source select buttons are used to select a background source on the preview output, this source is sent to the program bus when the next transition occurs. The currently selected preview source is indicated by a button that is illuminated green.

The source select buttons for the program bus match the preview bus.

INPUTS	Input buttons match the number of external switcher inputs.
BLACK	Black color source internally generated by the switcher.
BARS	Color bars source internally generated by the switcher.
COLOR 1 and 2	Color sources internally generated by the switcher.
MEDIA 1	Internal media player that display stills stored in the switcher.

Transition Control and Upstream Keyer

CUT

The CUT button performs an immediate transition of the program and preview outputs, overriding the selected transition style.

Transition control

AUTO/RATE

The AUTO button will perform the selected transition at the rate specified in the 'rate' display. The transition rate for each transition style is set in the transition palette for that style and is displayed in the 'rate' window of the transition control block when the corresponding transition style button is selected.

The AUTO button illuminates red for the duration of the transition and the 'rate' display updates to indicate the number of frames remaining as the transition progresses. When you perform a transition using the fader bar on an external ATEM hardware panel, the fader bar indicator on the software panel updates to provide visual feedback on the progress of the transition.

Fader Bar

The fader bar is used as an alternative to the AUTO button and allows the operator to manually control the transition with a mouse. The AUTO button illuminates red for the duration of the transition and the 'rate' display updates to indicate the number of frames remaining as the transition progresses.

Transition Style

The transition style buttons allow the operator to select one of four types of transitions; mix, dip, wipe and DVE. The selected transition style is indicated by a yellow illuminated button. Selection of these buttons will be reflected by the corresponding tab in the 'transitions' processing palette. For example, when you have the transitions processing palette open and click on a transition style button, the transitions palette will match your selection so you can quickly adjust the settings.

PREV TRANS

The PREV TRANS button enables the preview transition mode, allowing the operator to verify a mix, dip, wipe or DVE transition by performing it on the preview output using the fader bar. When the PREV TRANS is selected you will see the preview output match the program output, and then it's simple to practice your selected transition with the fader bar to confirm you are going to get what you want. This is a very helpful feature to avoid mistakes on air!

Next Transition

The BKGD and KEY 1 buttons are used to select the elements which will transition on air or off air with the next transition. More upstream keyers are available on 4K model ATEM switchers and that is why other upstream keyers appear greyed out. The key can be faded on and off when the main transition occurs, or you can select just the key to transition individually, so the main transition control can be used to fade the key on and off.

When selecting the elements of the next transition, the switcher operator should look at the preview video output because it provides an accurate representation of what the program output will look like after the transition is completed. When only the BKGD button is selected, a transition from the current source on the program bus to the source selected on the preview bus will occur without the keyer. You can also select only keyer to transition, leaving the current background live throughout the transition.

ON AIR

The ON AIR indicator button indicates when the key is currently on air and can also be used to immediately cut the key on or off air.

Downstream Keyer

TIE

The TIE button will enable the downstream keyer, or DSK, on the preview output, along with the next transition effects and tie it to the main transition control so that the DSK can be taken to air with the next transition.

The DSK will transition at the rate specified in the 'rate' display of the transition control block. If the DSK is tied, the signal routing to the clean feed 1 is unaffected.

ON AIR

The ON AIR button is used to cut the DSK on or off air and indicates whether the DSK is currently on or off air. The button is illuminated if the DSK is currently on air.

AUTO

The AUTO button will mix the DSK on or off air at the rate specified in the DSK 'rate' window. This is similar to the main AUTO rate on the transition control block, however it's limited only to the downstream keyer. This can be used to fade up and down bugs and logos, such as live or replay bugs during production, without interfering with the main program production transitions.

Fade to Black

Downstream key and fade to black

The FTB button will fade the whole program video output to black at the rate specified in the fade to black RATE window. Once the program output has been faded to black, the FTB button will flash red until it is pressed again. Doing so will fade up from black at the same rate, or you can enter a new rate in the fade to black palette in the 'switcher' window. Fade to black is mostly used at the start and end of your production, or when cutting to commercial breaks. It ensures all layers in ATEM Mini are faded down together. A fade to black cannot be previewed. You can also set the audio mixer to fade the audio with your fade to black by selecting the 'audio follow video' checkbox in the fade to black palette, or by enabling the AFV button on the master audio output fader.

Processing Palettes

The software control panel features tabs for the processing palette, media player, and output options.

TIP The palettes also show the order of the processing in the switcher. You can expand and minimize palettes to save space and scroll them up and down to get the adjustments you need to set.

The following processing palettes are available.

Palettes Tab

The 'palettes' tab contains the following processing controls.

Color Generators	Your ATEM switcher has two color matte generators which can be configured from the color generators palette using a color picker or by setting hue, saturation, and luminance levels.
Upstream Key	The switcher's upstream keyer can be configured from the upstream key palette. Within the keyer palette, the keyer can be configured as a luma key, chroma key, pattern key or DVE. The type of key available will also depend on if the DVE is available. The upstream key palette will display all the parameters that are available to configure the keyer. More information on how to use upstream keyer is included later in this manual.
Transitions	The transitions palette is where you can configure the parameters of each transition style. For example, for the dip transition the palette has a drop down menu where you can select the dip source and for the wipe transition the palette displays all the available wipe patterns. There are lots of variations of transitions and a large number of transitions can be created by combining settings and features in the transitions palette.

NOTE It's worth noting that selecting a specific style of transition in this palette will only adjust the settings for these transitions, and you still need to select the style of transition you want to perform in the transition control section on the software or ATEM Mini's control panel. The software and ATEM Mini's control panel work together and mirror all settings, so you can use any combination you like!

Downstream Key	ATEM Mini has a downstream keyer which can be configured from the downstream key palette. The palette has drop down boxes for selecting the fill and key signals to the keyer, plus sliders to set the pre multiplied key clip and gain values, and mask settings.
Fade to Black	The fade to black palette is where you can set the fade to black transition rate. An 'Audio Follow Video' checkbox is also provided as a shortcut for the audio mixer's master fader AFV button. Selecting this feature lets you fade your audio with your fade to black.

Media Player Tab

The 'media player' tab contains controls for your ATEM Mini's media player and connected HyperDecks.

Media Player	Your ATEM Mini has a media player that plays back the stills that are stored in the media pool memory built into the switcher. The drop down list is used to select the still that will be played or made available on the media player input to the switcher.
Hyperdecks	You can connect up to 4 Blackmagic HyperDeck Studio model disk recorders and control them using ATEM Software Control's HyperDecks palette. For more information refer to the 'HyperDeck Control' section of this manual.

Output Tab

The output tab lets you capture a still image from the program output. When using ATEM Mini Pro, this tab also contains additional options for you to live stream, record your stream and set the timecode generator. The capture video option supports the original ATEM production switchers that feature legacy USB output recording.

Live Stream

When using ATEM Mini Pro, this important output option lets you set up your live stream by entering the streaming details from your streaming platform. After assigning all the settings, you can start your broadcast by clicking the 'on air' button, then stop the broadcast by clicking 'off'.

The live stream status will clearly show you are on air by displaying a large red 'on air' indicator together with the timecode generator, which you can set using the timecode generator options.

Platform	Click in the 'platform' drop down list and select the streaming platform for your broadcast. Options include Facebook Live, YouTube Live and Twitch.
Server	Select the server that is closest to your location by clicking in the settings window and using the drop down list.
Key	Enter the stream key that has been assigned to your broadcast from the streaming platform. For information on how to obtain a stream key, refer to 'getting a stream key' in the 'connecting to a network' section.
Quality	Select the streaming quality and stream recording quality you want. This setting contains the following options: <ul style="list-style-type: none"> ▪ HyperDeck High 45 to 70 Mb/s ▪ HyperDeck Medium 25 to 45 Mb/s ▪ HyperDeck Low 12 to 20 Mb/s ▪ Streaming High 6 to 9 Mb/s ▪ Streaming Medium 4.5 to 7 Mb/s ▪ Streaming Low 3 to 4.5 Mb/s More information about the quality settings is included in this section of the manual.

For more information on how to use these options when setting up a live stream directly via Ethernet, including getting a stream key, refer to 'Streaming via Ethernet with ATEM Mini Pro'.

Even though the settings are nice and simple and you only need to select the service and a few other options, there is an XML file that has additional settings that knowledgeable users could take advantage of to add other streaming services and customize the streaming menu with low level settings. Refer to the 'changing switcher settings/saving and restoring switcher settings' section for more information on how to save and restore using an XML file.

Streaming and HyperDeck Quality Settings

The data rate used by the quality setting will change depending on the video standard ATEM Mini Pro is running at. For example, if you select Streaming High quality and are running at 1080p24 then it would use the 6 Mb/s data rate.

The data rates used on HyperDeck High are 45 to 70 Mb/s, the rates for HyperDeck Medium are 25 to 45 Mb/s and the data rates used for HyperDeck Low are 12 to 20 Mb/s. The streaming data rates are lower to allow for transmitting the data over the internet, so the data rate for Streaming High is 6 to 9 Mb/s, the data rate for Streaming Medium is 4.5 to 7 Mb/s and the data rate for Streaming Low is 3 to 4.5 Mb/s.

You will notice that each setting has 2 data rates mentioned. The lower number is used for the lower frame rates of 24p, 25p and 30p, while the higher data rates are used when you are running higher frame rates of 50p and 60p. It's also worth noting that the default setting for the streaming quality is Streaming High 6 to 9 Mb/s, as this gives a very high quality streaming channel, and the fairly good recording quality.

If you are not streaming, then you could just pick one of the HyperDeck quality settings. These are the same quality as the settings in HyperDeck Studio Mini and are a good quality data rate when you need broadcast quality recordings. However, with the latest software released for HyperDeck Studio Mini, it will also play the lower quality streaming data rates.

Record Stream

If you are recording your stream via USB-C on ATEM Mini Pro, this palette is where you can control your disks and start and stop recording. You can also set a file name and trigger record in all cameras when connected to Blackmagic Pocket Cinema Camera 4K and 6K.

NOTE When your ATEM Mini Pro's USB-C output is connected to an external disk for recording and you want to keep using ATEM Software Control, you will need to connect your ATEM Mini Pro to your computer via Ethernet.

Refer to the 'connecting to a network' section for more information.

File Name	Prior to recording, set a file name by typing it into the file name window. Click anywhere outside the window to confirm. If you stop and start recording, the file name will assign version numbers incrementally.
Drives	Formatted drives connected to your ATEM Mini Pro will appear as a list in the record window. You can assign drives by selecting them from the drop down menu. The drive window displays the disk capacity and record time remaining. Recording will always begin with the disk containing the largest available space, then proceed to the next disk with the largest available space. However, you can manually switch the drive you are recording to by clicking the 'switch' button. This is helpful if there is less than 5 minutes remaining on the current disk and you want to switch it over to the next disk at a determined moment in your broadcast.
Switch	Click the 'switch' button to change the drive you are currently recording to the next drive with the largest available space.

TIP You can also switch drives by holding down the record button on ATEM Mini Pro.

Record button	Click the record button marked 'rec' to start recording.
Stop button	Click 'stop' to stop recording.

Display status	Enable this feature by clicking the display status checkbox in the record options. The display status will appear in ATEM Software Control at the bottom right side of the user interface and shows the recording status. When recording, the record indicator will illuminate red and displays the current drive and record time remaining.
Record in all cameras	This feature lets you set all Blackmagic Pocket Cinema Cameras to record when you press the record button. This is helpful if you want isolated recordings from each camera for editing later. Cameras will be automatically set to record using Blackmagic RAW at the quality setting the camera was last set to.

Preparing Media for Recording

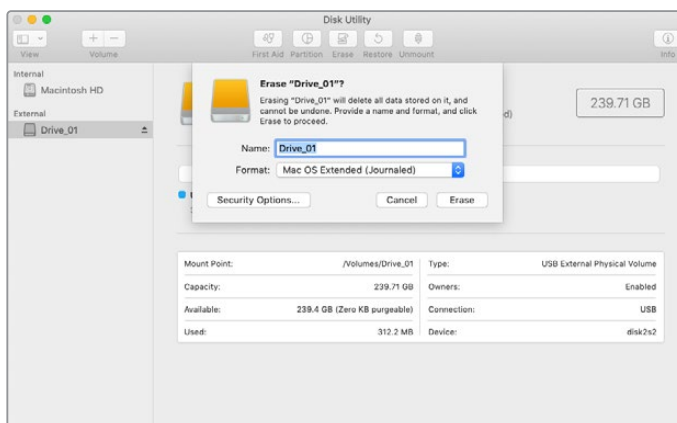

External disks can be formatted via a Mac or Windows computer. HFS+ is also known as Mac OS X Extended and is the recommended format as it supports ‘journaling’. Data on journaled media is more likely to be recovered in the rare event that your storage media becomes corrupted. HFS+ is natively supported by macOS. exFAT is supported natively by Mac and Windows without needing any additional software, but does not support journaling. This can be a good choice if you need to read or write to the disk using both Mac and Windows computers.

Preparing Media on a Computer

Formatting Media on a Mac Computer

The Disk Utility application included with your Mac can format a drive in the HFS+ or exFAT formats. Make sure you back up anything important from your disk as you will lose everything on it when it is formatted.

- 1 Connect your disk to your computer with an external dock, USB hub, or cable adapter and dismiss any message offering to use your drive for Time Machine backups.
- 2 On your computer, go to applications/utilities and launch Disk Utility.
- 3 Click on the disk icon of your drive and then click the erase tab.
- 4 Set the format to Mac OS Extended (Journaled) or exFAT.
- 5 Type a name for the new volume and then click erase. Your media will quickly be formatted and made ready for recording.

Formatting Media on a Windows computer

The format dialog box can format a drive in the exFAT format on a Windows PC. Make sure you back up anything important from your drive as you will lose everything on it when it is formatted.

- 1 Connect the drive to your computer with an external dock, USB hub, or cable adapter.
- 2 Open the start menu or start screen and choose computer. Right-click on your drive.
- 3 From the contextual menu, choose format.
- 4 Set the file system to exFAT and the allocation unit size to 128 kilobytes.
- 5 Type a volume label, select quick format and click 'start'.
- 6 Your drive will quickly be formatted and made ready for recording.

Use the Format dialog box feature in Windows to format your external disk in the exFAT format

Capture Video

The capture video option supports legacy model ATEM switchers with USB capture features.

Capture Still

If you need to capture a still image from your broadcast simply click on the 'capture still' button. This acts like a still store which lets you add capture files to the media pool. You can then immediately load a still into the media player and use it in your broadcast, or save the media pool to your computer.

To save the media pool:

- 1 Go to the menu bar at the top of your screen and click on 'file/save as'.
- 2 Choose the location you want to save to.
- 3 Click 'save'.

Now that your media pool is saved on your computer, you can access the captured stills and use them in your graphics software.

Timecode Generator

The timecode generator automatically runs time of day timecode from the moment you launch ATEM Software Control. However, you can reset the counter to zero, or manually enter a new timecode value to start from.

When using ATEM Mini Pro, the timecode generator can be set to time of day, or free run timecode where you can set a manual preset timecode

To manually set a preset timecode value:

- 1 Click in the 'run mode' drop down menu and select 'free run'.
- 2 In the smaller timecode counter, type in a defined timecode value. As you type, the new values will appear green.

To confirm the change and set the timecode running, click 'set'.

Time of Day

When ATEM Mini Pro is connected to your computer, the unit will sync time of day timecode with your computer. The unit has a built in clock that can continue running for approximately 6 days, so once you disconnect ATEM Mini Pro from your computer, the time of day timecode will continue until the battery is depleted. The battery will charge while connected to your computer via USB.

NOTE The timecode generator is also crucial when recording isolated files on Blackmagic Pocket Cinema Cameras 4K and 6K. When these cameras are connected to ATEM Mini's HDMI inputs, they will automatically conform to the ATEM timecode generator. That means when all cameras are recording the same timecode, you can edit your broadcast in post production and have all cameras easily synchronized on a multicamera timeline. For example, you can import your isolated camera recordings in DaVinci Resolve and setup a multicamera edit with all cameras synced to the same timecode.

Using the Audio Mixer

The audio tab is used to mix audio sources connected to ATEM Mini via HDMI and mic audio.

Cameras and external mic audio sources are listed along the top of the audio mixer along with the master audio output for the USB webcam program output to your computer.

The audio mixer displays tally lights for any audio sources that are currently on air or when AFV is selected, as well as audio level, audio balance and buttons for selecting which audio should be used

Below each audio source is an audio level meter, a fader for setting the maximum audio level, and a knob for setting the left/right audio channel balance. The master fader on the right side of the audio mixer is used to set the gain on the audio level on the USB webcam program output and has its own audio level meter. Next to the master fader are mic faders which let you control the audio level for microphones connected to the mic inputs.

The buttons below each audio level meter determine whether audio is always available for mixing or only when the source is on air.

The solo monitoring feature for each input is greyed out as it supports ATEM Production Studio and Broadcast Studio model switchers.

Tally

Any source whose audio is on air is lit with a red tally light in the software. In the example on this page, camera 3 and camera 4 are lit because their audio is set to be always on. The tally light will be illuminated dull yellow when AFV is selected and the channel's associated camera is off air. This also applies to the master fader tally light when the master fader AFV button is selected. When FTB is activated, the master fader tally light will blink red.

Audio Level

Drag the audio level fader to set the gain on the audio level for each camera and audio source. The numbers under each audio level meter show the maximum audio level set by the fader. The numbers above the audio meter show the peak audio level reached by the audio source. A green number represents low to medium audio levels.

If the audio meter is regularly showing red, and the red number above it is not changing, then you should reduce the audio level to avoid audio distortion. After adjusting the audio level, you may wish to reset the red number by clicking on it once. Observe the new number to make sure it changes for a while and does not immediately shoot up and become stuck on a red number. If it does, you may need to reduce the audio level even further.

Audio Balance

The audio mixer supports stereo audio from each audio source. If you wish to change the left and right audio channel balance for a camera or other audio source, adjust the knob to the desired balance point.

The audio meter for Cam1 is shown in gray to indicate that its audio will not be used as neither of its ON or AFV buttons are enabled. Cam2 has AFV selected but its audio is not currently being used as the camera is not on air as is indicated by its dull yellow tally light. Cam3 and Cam4 have their direct mix set to ON so their mixed audio is always used and their tally lights remain lit, even if another camera is currently on air. The audio level meters for Mic 1 and Mic 2 show that no audio is present on these inputs.

Audio Source Selection

Below each audio level meter, you will find the ON and AFV buttons that select which audio sources are sent to the program output of the switcher.

ON	Selecting the direct mix to ON allows an audio input to be permanently mixed into the program output, even when the associated video source is not on air. The red tally light will always be lit because the audio is always on air. Selecting this option automatically disables AFV.
Audio Follow Video	Audio follow video allows audio to crossfade when inputs change. The audio will only be sent to the program output when the input is on air, lighting the red tally light above. When off air, the tally light is lit dull yellow. Selecting this option automatically disables the direct mix ON setting.
SOLO	The solo feature appears as a headphones icon below each input and is available for ATEM Production Studio and Broadcast Studio model switchers.

Master Audio Level Output

The master fader on the right side of the audio mixer is used to set the gain on the audio level for the USB webcam program output and has its own audio level meter. Select the AFV button on the master audio output fader to enable the AFV fade to black feature. This lets you fade your master audio when you click on the fade to black button.

Audio Mixer Monitor

The monitor headphones sliders appear below the master fader and control the monitoring audio output behavior on ATEM Television Studio model switchers.

Shaping your Audio Mix using Advanced Fairlight Controls

ATEM Mini has advanced Fairlight audio controls that let you enhance and refine the quality of sound on each input and master output, including input level controls, a 6 band parametric equalizer and powerful dynamics settings.

This section of the manual shows the different Fairlight audio controls you can use to shape and optimize the audio mix in your live production.

Input Level

Generally, when setting up your audio mix, the first step is to normalize all your inputs. This means adjusting the input level knob on each input so you can optimize all the levels to their highest strength without clipping.

This control is at the top of each track under the tally light. Change the level by clicking on the knob and dragging left to decrease the level, or right to increase. By setting the input control, it brings all the inputs up to a common signal strength so they are all at their strongest without clipping.

After you have normalized all your input levels, you can now begin optimizing and shaping the qualities in each audio input using the 6 band parametric equalizer and dynamics controls.

Delay Control

Sometimes when using analog audio via your ATEM Mini's mic inputs, there may be a slight difference in the sync between analog audio and video. For example, the analog audio may sound slightly ahead of the video. This is because analog audio is independent of the video inputs and is coming directly from an external source, while the HDMI inputs might have some delay depending on upstream equipment, such as some cameras and video processors. Setting the audio delay will ensure the analog audio input is perfectly AV synced to the video inputs from cameras.

To adjust the amount of delay on the selected input:

- 1 Click on the delay indicator beneath the input audio level control knob on the channel strip.

Click on the delay indicator below the level input knob to open the delay control.

A small popup window will open containing the delay adjustment knob.

- 2 Click on the delay knob and drag left to decrease the amount of delay, or drag right to increase. The amount of delay is measured in frames. Close the window by clicking on the small 'x' in the top corner, or move the window to a safe place on your desktop if you need to make further adjustments later.

Click on the delay control and drag left or right to decrease or increase the amount of delay required for an analog input

Using the 6 Band Parametric Equalizer

Each input and the master output has a 6 band parametric equalizer which can be used to control specific frequencies. This could include reducing low frequency hum or noise on a microphone input, or boosting the low frequencies on a thin sounding track, or even to add uniqueness to each input so they are more distinct in the final mix. You have many creative options.

Parametric Equalizer

To open the parametric equalizer for an input or the master output, click on the corresponding equalizer indicator.

Click on an input's equalizer indicator to open a 6 band parametric equalizer

The first item you will notice is the graph along the top of the window with numbered indicators from 1 to 6. These numbered indicators are adjustable handles that correspond to bands 1 to 6.

Each band of the 6 band parametric equalizer has a column of settings. These settings will differ based on which band you are controlling, and what filter type you are using.

Each audio input has its own 6 band parametric equalizer

TIP You can learn more about band filters later in this section.

If you want to make changes to a setting, you will first need to make sure the band is enabled. Click on a band label to enable it. When enabled, the button label is illuminated blue. Now you can change the settings for that band, or click and drag the handles to make fast adjustments.

Handles

Each band handle is positioned along the line curve displayed in the graph. You can click and drag each handle to choose the frequency you wish to adjust for that band, and the gain you want to set. When moving a handle with your mouse, both the frequency and gain settings are affected simultaneously, which gives you a fast way to make quick adjustments to each band across the entire range of frequencies.

NOTE To make changes using a handle, ensure the band is enabled. Simply click on the band you want to adjust. The band label will illuminate blue when enabled.

As you drag a handle left or right, you will notice the frequency and decibels update in the band settings. This will also be reflected by the frequency range preset buttons for low, medium low, medium high, and high.

Frequency Knobs

Alternatively, you can use the frequency knobs for each band to select a specific frequency to adjust.

Range Presets

The frequency range for each band is defined by the range preset buttons. For example, low is labeled 'L' and covers the frequency range from 30 to 395 Hz.

As a quick example of how the range presets define the frequency range, select a notch filter from the band filter dropdown list, and then click on each range preset. You will see the filter effect move to a position along the graph curve that corresponds to the range preset you choose. This lets you quickly define a specific range of frequencies you want the filter to affect.

Below is a table showing the range of frequencies for each range preset setting.

Range Preset	Frequency Range
Low	30 Hz to 395 Hz
Mid Low	100 Hz to 1.48 kHz
Mid High	450 Hz to 7.91 kHz
High	1.4 kHz to 21.7 kHz

Gain Knobs

Click and drag the gain knob left or right to decrease or increase the volume level for the selected frequency.

Q Factor

The Q factor control is available when the bell filter is applied to bands 2, 3, 4 and 5. This sets the range of frequencies the filter will affect. For example, setting the minimum will allow the filter to affect a wide range of surrounding frequencies and the maximum setting will narrow the effect down to a tiny point. This is important if you have sound qualities in surrounding frequencies that you want to either include or exclude from the change you are making.

As you adjust the Q factor, watch the shape of the effect on the line curve change from a broad, rounded edge to a sharp point. This is a visual representation showing how the regions of frequencies surrounding the target frequency are affected.

TIP Compare the audio with changes against the original unaltered audio by clicking on the bypass button at the very top of the equalizer window. This lets you turn the equalizer on or off.

Band Filters

There are six different types of band filters you can choose from. These filters include bell, high shelf, low shelf, notch, high pass, and low pass. These filters let you control specific zones within the frequency range. For example, a low shelf filter lets you increase or decrease the level of volume for lower frequencies on the graph, and a high shelf filter controls the higher frequencies.

Try setting a low shelf filter to band 3 and make changes to the gain setting. You will see the changes are weighted towards the low end frequencies on the graph.

A description for each filter type is provided below.

<p>Bell</p>  <p>This filter is used to increase or decrease a range of frequencies surrounding a defined frequency.</p>	<p>High Shelf</p>  <p>Lets you increase or decrease the level of volume for higher frequencies along the graph.</p>	<p>Low Shelf</p>  <p>Lets you increase or decrease the level of volume for lower frequencies along the graph.</p>
<p>Notch</p>  <p>This filter lets you remove, or cut, a defined frequency.</p>	<p>High Pass</p>  <p>Smoothly removes extreme low end frequencies, allowing the high end frequencies to pass unaffected.</p>	<p>Low Pass</p>  <p>Smoothly removes extreme high end frequencies, allowing the low end frequencies to pass unaffected.</p>

TIP It's not uncommon to have filters on each band overlapping on the graph curve with adjustments working together. For example, you may have a low shelf filter applied to band 4, and a notch filter on band 5 reducing a frequency within the same range.

Dynamics Controls

In addition to the 6 band parametric equalizer, you can also enhance and finesse the input and master output audio using dynamics controls. Where the equalizer lets you control the frequencies within a signal, dynamics controls let you set how various levels behave. Levels within the signal can be adjusted including expanding the dynamic range between low levels and high levels, gating an input so you can choose what is stronger or softer within a signal, or you can even use the compressor and limiter so that audio can be generally lifted and made stronger without clipping.

Combined with equalizer controls, these features are extremely powerful, giving you the ability to precisely shape and define the audio and generally optimize the sound of the master output.

This section describes the expander, gate, compressor and limiter controls.

The dynamics controls can be opened for each input and the master output by clicking on its corresponding dynamics indicator

Common Dynamics Settings

The expander/gate, compressor and limiter share common settings that let you shape how each function affects the audio. For example the level at which the function initiates, how long the function is applied, the strength of the function, etc. The settings available differ depending on the dynamics control you are using.

Threshold	Sets the sound level at which the function activates. For example, setting the threshold for the compressor to -20dB tells your switcher to activate compression when the signal rises above -20dB. Alternatively, setting the expander to -40dB means the switcher will only initiate the expander once the signal level drops below -40dB.
Range	This setting defines the range of decibels affected by the function.
Ratio	Defines the maximum strength of the function once initiated.
Attack	Sets the smoothness of the function when it initiates. For example, a long attack will allow the function to fade into the signal, blending in better without drawing too much attention, whereas a short attack may be better for complex sound activity with many quick variations where a longer attack may cause artifacts.
Hold	Sustains the dynamics function over an adjustable period of time.
Release	Similar to attack but occurs at the end of the function activity. For example, lets the dynamics function ease out gradually, or fall away rapidly, once the level moves out of the threshold.

Expander/Gate

The first set of dynamics parameters can be switched between expansion and gating.

Expansion emphasizes differences in volume by lowering the level of soft parts of the signal relative to the level of louder parts. You can use an expander to emphasize the differences between quiet and loud parts of a track, or to increase the dynamic range of a signal and minimize unwanted noise.

Gating is like an exaggerated expander, reducing the level or even silencing parts of a signal that fall below a certain level in order to reduce or eliminate noise in quiet parts of a recording. For example, a range of 15 to 20 dB can reduce breathing in a vocal track but leaves just enough to sound natural.

Gating is extremely effective, but it's also very powerful so requires careful attention. If the gate threshold is set too high it can cause artifacts, such as cutting off the start of a syllable or the quiet end of a word. You can compensate by reducing the threshold slightly, or by increasing the attack or release time.

Compressor

Compression lets you reduce peaks in an audio signal, reducing the dynamic range of a signal, so you can boost the overall level without clipping. This is helpful when you want to make sure the loud elements in a signal don't diminish the strength of quieter sounds, or to smoothen changes in audio levels within the signal.

TIP It's a good idea to apply the compressor after you have set the EQ controls.

Make Up

The make up setting lets you increase the overall signal in combination with compression settings. With loud parts of the audio reduced using compression, you can now use the make up control to boost the overall sound without clipping.

Limiter

The limiter prevents peaks of the signal from exceeding a set maximum level. A limiter is helpful to prevent hard clipping. For example, if you set the limiter to -8 dB, the input signal will never exceed that level. Adjusting the attack, hold and release settings will set how gentle the limiter affects the signal.

Dynamics Controls Characteristics

Control	Minimum	Default	Maximum
Expander/Gate			
Expander Controls*			
Threshold	-50dB	-45dB**	0dB
Range	0dB	18dB	60dB
Ratio	1.0:1	1.1:1	10:1
Attack	0.5ms	1.4ms	30ms
Hold	0.0ms	0.0ms	4s
Release	50ms	93ms	4s
Expander/Gate			
Gate Controls*			
Threshold	-50dB	-45dB**	0dB
Range	0dB	18dB	60dB
Attack	0.5ms	1.4ms	30ms
Hold	0.0ms	0.0ms	4s
Release	50ms	93ms	4s
Compressor			
Compressor Controls			
Threshold	-50dB	-35dB	0dB
Ratio	1.0:1	2.0:1	10:1
Attack	0.7ms	1.4ms	30ms
Hold	0.0ms	0.0ms	4s
Release	50ms	93ms	4s
Limiter			
Limiter Controls			
Threshold	-50dB	-12dB	0dB
Attack	0.7ms	0.7ms	30ms
Hold	0.0ms	0.0ms	4s
Release	50ms	93ms	4s

* Master Dynamics expander/gate controls are unused in Master Dynamics.

** Master Dynamics expander/gate threshold default is -35dB.
Mic Dynamics expander/gate threshold default is -45dB.

Fairlight Controls Workflow Guide

This section describes a basic workflow to help you get started using the Fairlight controls to refine and enhance your audio mix.

- 1 Generally, the first step to optimizing your mix is to normalize all the inputs so they are all at their maximum strength without clipping. This is normally done by increasing or decreasing the input gain level for each input so their signal peaks just below 0dB on the channel strip's level indicator.
- 2 If you want to split any mono inputs into two separate channels for stereo output, go to the general switcher settings and navigate to the audio tab. Enable the checkboxes for the mono inputs you want to change to stereo. Click 'done'.

TIP If you want to split mono inputs into two separate channels, it's best to do this before normalizing the input as described in step 1, so that you can normalize both channels after they have been split.

- 3 Now, click on the EQ indicators below input level controls and make equalization changes to each input. You can move the windows into a better position, or close them if needed.
- 4 After setting EQ, open the dynamics controls for each input by clicking on their respective dynamics indicator. Make the required dynamics changes to generally improve and refine the input audio.
- 5 With EQ and dynamics set for each input, you can now open the EQ controls for the master output and sweeten the final audio mix.
- 6 Now open the master output's dynamics controls and make any required changes to improve the final output.

Once all the Fairlight controls are set, you can then increase or decrease the faders on the audio mixer to set them at their best levels for the live mix and make adjustments where necessary during the production. You can also go back to any of the settings and make further adjustments if needed, but it's best to follow the same order as described above to get the best results from each function. For example, it's important to set EQ controls before making dynamics changes as the processing chain in your switcher applies dynamics to the audio after equalization.

Most important of all is to apply the effects carefully so your audio still sounds natural but exciting too!

Using the Media Page

The media page is where all your graphics or stills are stored and is very easy to use. Simply find the still you want to use with the browse window, then drag and drop the file into a slot in the media pool. From there, you can load any one of those stills into the media player and switch it to air using the media player 1 source button on the software control panel. You can also use stills in the media player with the upstream and downstream keyer.

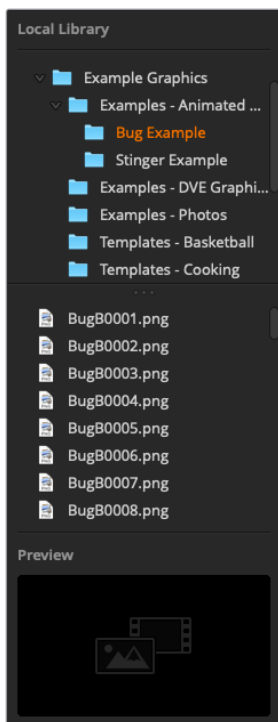

Keep reading this section for information on how to use the media page in ATEM Software Control.

Navigating the Browse Window

The browse window is a simplified file browser that lets you navigate your computer to look for graphics files. All attached drives on your computer are displayed, and you can select folders from them. View sub folders by clicking on the arrows next to each folder.

The 'preview' window will show any selected graphics files.

Browse window

Browsing and loading files

Loading a still is as easy as dragging it from the browse window and dropping it into an empty slot in the media pool.

When dropping a still into a slot, a progress indicator will show the loading status. You can drop multiple files into the media pool, even if the first images have not yet completed loading, as they will continue to load one after the other. If a still is dropped into a window which already has content loaded, the existing content will be replaced.

The ATEM media pool supports PNG, TGA, BMP, GIF, JPEG and TIFF still image formats.

ATEM Media Pool

When files have been loaded into the media pool, the slots will show a thumbnail image. Stills are marked with a slot number so you can identify them when assigning a still image to the media player when using an external ATEM hardware panel.

The file name for each loaded file is displayed underneath the slot so you can easily keep track of files you have loaded. This is very useful as you will see a list of media pool still and clip numbers and their file names in the media player palette on the switcher page.

Numbers are displayed on slots in the media pool to clearly show which slot is assigned to the media player. When a media player slot is switched to the program output, the media player number on the slot changes to red to indicate the slot is on air. When a slot is on the preview output, the media player number changes to green.

ATEM Media Pool

On the switcher page, you can change the media player assignment from the media tab by selecting your desired still from the 'media' dropdown list. Simply click on the arrow in the player 'media' list to select from a list of media pool slots.

Image File Types

The ATEM media page can use many different file formats including TGA, PNG, BMP, GIF, JPEG and TIFF.

Formats such as TGA include a separate 'alpha' channel together with the RGB color channels. This lets you embed a matte, or key image, inside that alpha channel. When a TGA image is loaded in the media player, ATEM Software Control will automatically detect the key image in the alpha channel and load it as the linear key source. This means your TGA graphic will key beautifully straight away with perfect transparency.

Creating a TGA File with an Alpha Channel

Below is a demonstration showing how to create a title in Photoshop with an alpha channel.

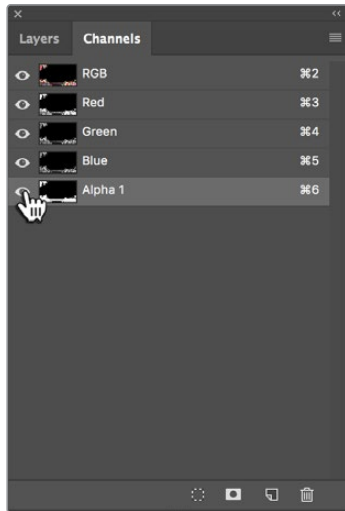

- 1 Launch Adobe Photoshop and start a new project. Set the project to use the same horizontal and vertical dimensions used in your broadcast video format. For example, if you are broadcasting 1080p50, set the resolution to 1920 x 1080 pixels.
- 2 In the layers panel, create a new layer and build the graphic you want to use. In this demonstration, we are using a 'wedding' lower thirds graphic.
- 3 Hold down the 'command' key on a Mac, or 'control' key for Windows, and click on the layer thumbnail for your graphic. This will generate a selection of the color channels' opacity values in your image. Their opacity determines the transparency of the graphic.

- 4 Go to the adjoining 'channels' panel and click on the 'save selection as channel' tool.

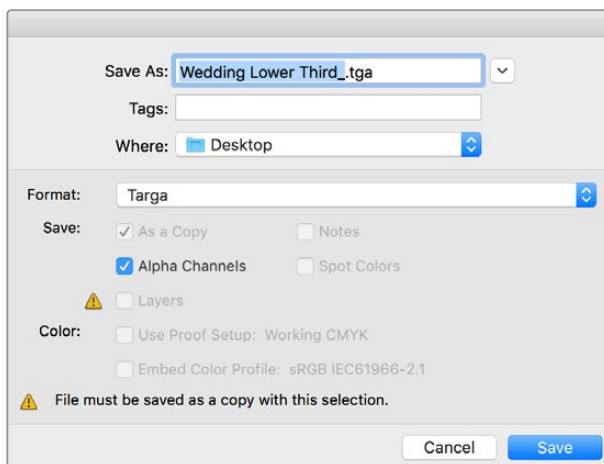

You will now see an alpha channel appear underneath the RGB color channels. The alpha channel contains a greyscale version of the combined color channels in your graphic. Don't forget to click on the alpha channel's 'eye' icon to make sure it is selected so it will be included when the TGA file is saved.

- 5 Your selection has now been used to create the greyscale matte in the alpha channel. If you want to, you can now go to the 'menu' bar and click 'select/deselect' to remove the selection marquee.

- 6 Now it's time to save your TGA file.

Go to the file menu and click on 'save as'. Type the file name and select the location for your file. In the format box, select 'targa', which is the full name for a TGA file and make sure the 'alpha channels' checkbox is selected.

- 7 Click 'save'. A targa options box will appear asking which resolution you want to save. Select '32 bits/pixel'. This provides enough data for four 8 bit channels which includes the red, green and blue color channels, plus the alpha channel. Click 'OK'.

Your TGA file is saved.

Now you can open ATEM Software Control and load the file into the media pool. From there, drop the graphic into the media player and the alpha channel you saved will automatically be loaded into the media player key source. The key source uses the greyscale image in the alpha channel to tell the linear keyer transparency values for the graphic.

If you switch the linear key to air, you will now see the graphic keyed over the background with perfect transparency.

Using Camera Control

Clicking on the 'camera' button in ATEM Software Control opens the camera control feature that lets you control Blackmagic Pocket Cinema Camera 4K and 6K from your ATEM Mini. Camera settings such as iris, gain, focus, detail and zoom control are easily adjusted using compatible lenses, plus you can color balance cameras and create unique looks using the DaVinci Resolve primary color corrector that's built into the camera.

ATEM Camera Control.

When controlling cameras, the ATEM switcher control works by broadcasting camera control packets via all the HDMI inputs of your ATEM Mini. So this means you can connect an HDMI input of your ATEM Mini to the camera's HDMI connector and the camera will detect the control packets in the HDMI signal and allow you to control features in the camera.

ATEM Software Control automatically knows which camera is connected to each input, so the tally signals will always trigger the appropriate cameras. However, if you want to change the button mapping so camera inputs appear on different buttons, you can do that in the button mapping settings in ATEM Software Control's preferences.

Camera Control Panel

Launch ATEM Software Control and click on the 'camera' button located at the bottom of the software window. You'll see a row of labeled Blackmagic camera controllers containing tools to adjust and refine each camera's image. The controllers are easy to use. Simply click the buttons using your mouse, or click and drag features to adjust.

Camera Control Selection

The button row at the top of the camera control page lets you select the camera number you would like to control.

Channel Status

The channel status at the top of each camera controller displays the camera label, On Air indicator and lock button. Press the lock button to lock all the controls for a specific camera. When on air, the channel status illuminates red and displays the On Air alert.

Camera Settings

The camera settings button near the bottom left of the master wheel lets you adjust detail settings for each camera's picture signal.

Each camera controller displays the channel status so you know which camera is on air. Use the color wheels to adjust each YRGB channel's lift, gamma and gain settings.

Detail

Use this setting to sharpen the image from your cameras live. Decrease or increase the level of sharpening by selecting: Detail off, detail default for low sharpening, medium detail and high detail.

Color Wheel

The color wheel is a powerful feature of the DaVinci Resolve color corrector and used to make color adjustments to each YRGB channel's lift, gamma and gain settings. You can select which setting to adjust by clicking on the three selection buttons above the color wheel.

Master Wheel

Use the master wheel below the color wheel to make contrast adjustments to all YRGB channels at once, or luminance only for each lift, gamma or gain setting.

Reset Buttons

The reset button near the bottom right of each camera controller lets you easily choose color correction settings to reset, copy or paste. Each color wheel also has its own reset button. Press to restore a setting to its default state, or copy/paste a setting. Locked controllers are not affected by the Paste feature.

The master reset button on the bottom right corner of the color corrector panel lets you reset lift, gamma and gain color wheels plus Contrast, Hue, Saturation and Lum Mix settings. You can paste color correction settings to camera controllers individually, or all cameras at once for a unified look. Iris, focus, coarse and pedestal settings are not affected by the Paste feature. When applying Paste to all, a warning message will appear asking you to confirm your action. This is so you don't accidentally paste new settings to any unlocked cameras that are currently on air.

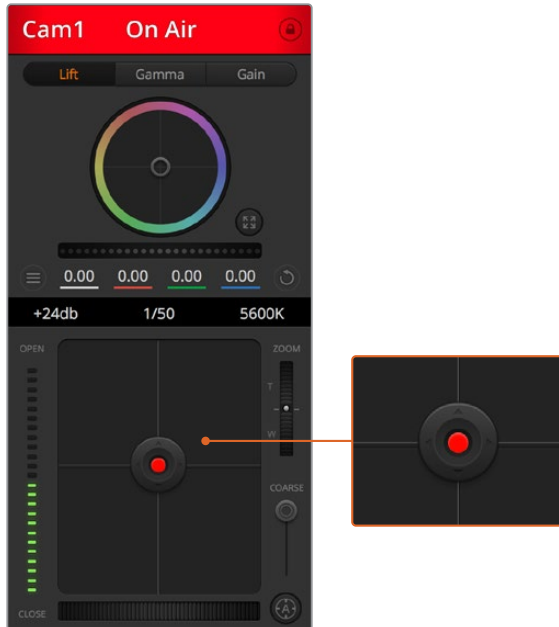

When applying 'paste to all', a warning message will appear asking you to confirm your action. This is so you don't accidentally paste new settings to any unlocked cameras that are currently on air.

Iris/Pedestal Control

The iris/pedestal control is located within the cross hairs of each camera controller. The control illuminates red when its camera is on air.

To open or close the iris, drag the control up or down. Holding the shift key allows only iris adjustments.

To darken or lift the pedestal, drag the control left or right. Holding the command key on a Mac, or the Control key on Windows, allows only pedestal adjustments.

The iris/pedestal control illuminates red when its respective camera is on air.

Zoom Control

When using compatible lenses with an electronic zoom feature, you can zoom your lens in and out using the Zoom control. The controller works just like the zoom rocker on a lens, with telephoto on one end and wide angle on the other. Click on the zoom control, located above the coarse slider and drag up to zoom in, or drag down to zoom out.

Coarse Setting

The coarse setting is located to the right of the iris/pedestal control and is used to limit the iris range. This feature helps you prevent over exposed images from going to air.

To set your coarse threshold, completely open the iris using the iris control, then drag the coarse setting up or down to set optimum exposure. Now when you adjust the iris, the coarse threshold will prevent it from going above optimum exposure.

Iris Indicator

The iris indicator is located to the left of the iris/pedestal control and displays a visual reference so you can easily see how open or closed the lens aperture is. The iris indicator is affected by the coarse setting.

Auto Focus Button

The auto focus button is located at the bottom right corner of each camera controller. Press to automatically set the focus when you have an active lens that supports electronic focus adjustments. It's important to know that while most lenses support electronic focus, some lenses can be set to manual or auto focus modes and so you

need to ensure your lens is set to auto focus mode. Sometimes this is set by sliding the focus ring on the lens forward or backward.

Click on the auto focus button or drag the manual focus adjustment left or right to focus a compatible lens.

Manual Focus Adjustment

When you want to adjust the focus on your camera manually, you can use the focus adjustment located at the bottom of each camera controller. Drag the wheel control left or right to manually adjust focus while viewing the video feed from the camera to ensure your image is nice and sharp.

Camera Gain

The camera gain setting allows you to turn on additional gain in the camera. On Blackmagic Pocket Cinema Cameras, this setting relates to ISO. This is important when you are operating in low light conditions and need extra gain, or ISO, in the front end of the camera to avoid your images being under exposed. You can decrease or increase gain by clicking on the left or right arrows on the dB gain setting.

You can turn on some gain when you need it, such as outdoor shoots when the light fades at sunset and you need to increase your image brightness. It's worth noting that adding gain will increase noise in your images.

Shutter Speed Control

The shutter speed control is located in the section between the color wheel and the iris/pedestal control. Decrease or increase the shutter speed by hovering your mouse pointer over the shutter speed indicator and then clicking on the left or right arrows. On Blackmagic Pocket Cinema Cameras, this setting relates to shutter angle.

If you see flicker in lights you can decrease your shutter speed to eliminate it. Decreasing shutter speed is a good way to brighten your images without using camera gain because you are increasing the exposure time of the image sensor. Increasing shutter speed will reduce motion blur so can be used when you want action shots to be sharp and clean with minimal motion blur.

White Balance

The white balance setting next to the shutter speed control can be adjusted by clicking on the left or right arrows on each side of the color temperature indicator. Different light sources emit warm or cool colors, so you can compensate by adjusting the white balance. This ensures the whites in your image stay white.

Hovering your mouse pointer over the gain, shutter speed and white balance indicators reveal arrows you can click on to adjust their respective settings.

DaVinci Resolve Primary Color Corrector

If you have a color correction background, then you can change your camera control from a switcher style CCU interface to a user interface that's more like a primary color corrector on a post production color grading system.

Blackmagic cameras feature a DaVinci Resolve primary color corrector built in. If you have used DaVinci Resolve, then creatively, grading in the Blackmagic camera will be identical so you can use your color grading experience for live production. The color corrector panel can be expanded out of any camera controller and provides expanded color correction control with extra settings and a full primary color corrector interface.

Click on the DaVinci Resolve primary color corrector button to expand the color correction window and adjust settings.

You have color wheels and settings such as saturation available and you can see shadows, mid tones and highlight settings all at the same time. Simply switch between cameras using the camera selection controls at the top of the window as you need.

Lift, gamma and gain color wheels in the color corrector panel.

Color Wheels

Click and drag anywhere within the color ring

Note that you don't need to drag the color balance indicator itself. As the color balance indicator moves, the RGB parameters underneath change to reflect the adjustments being made to each channel.

Shift-Click and drag within the color ring

Jumps the color balance indicator to the absolute position of the pointer, letting you make faster and more extreme adjustments.

Double-click within the color ring

Resets the color adjustment without resetting the master wheel adjustment for that control.

Click the reset control at the upper-right of a color ring

Resets both the color balance control and its corresponding master wheel.

Master Wheels

Use the master wheels below the color wheels to adjust each YRGB channels' lift, gamma and gain controls.

Adjust the master wheels by dragging the wheel control left or right.

To make adjustments using the master wheel:

Drag the master wheel left or right

Dragging to the left darkens the selected parameter of the image, dragging to the right lightens that parameter. As you make an adjustment, the YRGB parameters underneath change to reflect the adjustment you're making. To make a Y-only adjustment, hold down the ALT or Command key and drag left or right. Because the color corrector uses YRGB processing, you can get quite creative and create unique affects by adjusting the Y channel only. Y channel adjustments work best when the Lum Mix setting is set to the right side to use YRGB processing vs the left side to use regular RGB processing. Normally, most DaVinci Resolve colorists use the YRGB color corrector as you get a lot more control of color balance without affecting overall gain, so you spend less time getting the look you want.

Contrast Setting

The Contrast setting gives you control over the distance between the darkest and lightest values of an image. The effect is similar to making opposing adjustments using the lift and gain master wheels. The default setting is 50%.

Saturation Setting

The Saturation setting increases or decreases the amount of color in the image. The default setting is 50%.

Hue Setting

The Hue setting rotates all hues of the image around the full perimeter of the color wheel. The default setting of 180 degrees shows the original distribution of hues. Raising or lowering this value rotates all hues forward or backward along the hue distribution as seen on a color wheel.

Lum Mix Setting

The color corrector built into Blackmagic cameras is based on the DaVinci Resolve primary color corrector. DaVinci has been building color correctors since the early 1980's and most Hollywood films are color graded on DaVinci Resolve than any other method.

This means that your color corrector built into the camera has some unique and creatively powerful features. The YRGB processing is one of those features.

When color grading, you can choose to use RGB processing, or YRGB processing. High end colorists use YRGB processing because you have more precise control over color and you can independently adjust the channels with better separation and more creative options.

When the Lum Mix control is set to the right side, you have the 100% output of the YRGB color corrector. When you have the Lum Mix control set to the left side, you get 100% output of the RGB corrector. You can set the Lum Mix to any position between the left and right to get a blend of output from both the RGB and YRGB correctors.

Drag the sliders left or right to adjust Contrast, Saturation, Hue and Lum Mix settings.

Which is the correct setting to use? That's up to you, as color correction is a pure creative process and there is no right and wrong. The best setting is what you like the most and what you think looks good!

Synchronizing Settings

When connected, camera control signals are sent from your ATEM switcher to the Blackmagic camera. If a setting is accidentally adjusted from your camera, camera control will automatically reset that setting to maintain synchronization.

Using Macros

What is a Macro?

A macro is an easy way to automate a sequence of switcher actions so you can repeat the sequence at the press, or click, of a button. For example, you can record a sequence of transitions between several video sources, including key effects, audio mixer adjustments, camera control settings and more. Record all your actions to a macro button, then when you press that button all your recorded actions will be instantly performed. Macros are recorded using the macros window in ATEM Software Control, and are stored inside your ATEM Mini. You can run all your recorded macros using the software control panel.

The Macros Window in ATEM Software Control

To open the macros window in ATEM Software Control, click on macros in the title bar, or you can also press shift/command/M for Mac, or shift/control/M for Windows. The macros window is a floating window you can move freely about your desktop. This is so you can always access the window when moving between the switcher, media, audio and camera pages. While recording a macro, you can even reduce the size of the window by clicking on the minimize icon at the top right corner.

The macros window in ATEM Software Control lets you record and run macros so you can easily repeat a sequence of complex switcher actions at the click of a button.

Macros can be recorded to any of the 100 macro slots. Up to 20 macro slots are visible on each page. Move forwards and backwards through pages by clicking on the arrows on the bottom sides of the window. Clicking on the create and run buttons lets you swap between the create and run pages so you can record your macros, and then run them during your live production.

Recording Macros

Macros need to be recorded comprehensively, in clearly defined sequences from start to finish without error. This is because your macro will record every setting, press of a button, and switcher action you perform. When you run a macro, all the switcher actions you recorded in that macro will be repeated precisely.

It's worth highlighting that a macro will only record the settings you change. For example, if you want a 3:00 second transition, and your switcher's transition rate is already set to 3:00 seconds, you'll need to change the duration, then set it back to 3:00 seconds to record the setting. If not, your desired transition rate will not be recorded and when the macro is run it will simply use the transition rate your switcher was last set to. So you can see why precision is important!

If settings are changed while recording a macro and you want them restored to a particular state, simply restore those settings while recording the final steps of the macro. You can even record macros to restore settings for various projects. You have lots of choices. The important thing to remember when recording a macro is that you change all the settings you need to so you can create the specific effects you want.

Recording a Macro using ATEM Software Control

In the example below, we're going to create a macro that will set your ATEM switcher to perform a 3 second mix transition from color bars to color 1, pause for 2 seconds, then perform a 3 second mix transition to black. Try building this macro on your ATEM switcher so you can learn the steps in creating macros.

- 1 Launch ATEM Software Control and open the macros window.
- 2 Click on the create button in the macros window to select the create page.
- 3 Click on a macro slot you want to record your macro to. In this example, click on macro slot 1. An orange border will appear around the slot you have selected.
- 4 Click on the create macro button, which is labeled with a 'plus' icon, to open the create macro popup window.

If you want to, you can enter the name of your macro and type a description. This lets you easily keep track of your macros and quickly see what each macro does. When you click on a macro, your notes will appear in the status window.

To start recording a macro, select a macro slot, then click on the create macro button. Type in your notes and click 'record'.

- 5 Click the 'record' button.

The popup window will close and a red border will appear around your ATEM Software Control panel indicating your macro is now recording. Notice the red 'add pause' button at the top of the border.

Now that your macro is recording, you can start performing your switcher actions.

While recording, the create macro button will change to a 'record' button. When you have completed your switcher actions, click on the 'record' button to stop recording.

- 6 Click on the bars button in the program panel on the switcher page. This sets bars to your switcher's program output.
- 7 Select color 1 on the preview output.
- 8 Open the transitions palette and set it to mix.

If mix is already selected, make sure your macro records the setting by selecting a different transition type, for example the wipe transition, then clicking on mix again.

- 9 Now change the transition Rate to 3:00. This sets the mix transition duration to 3 seconds.
- 10 Click on the auto button in the transition style panel. Your switcher will perform a mix transition from color bars to color 1.
- 11 To set the switcher to wait for 2 seconds before applying another transition, click on the add pause button at the top of the red border. The 'insert pause' window will open. Set the pause to 5 seconds and 00 frames and click 'confirm'.

Why set a 5 second pause when you only want a 2 second pause? That's because when the mix transition occurs, it takes 3 seconds to complete. So if you want to add a pause, you need to consider the transition duration, plus the pause you want to happen before the next transition occurs.

In this example, it takes 3 seconds for the transition to complete, then 2 seconds for your 2 second pause, so you should enter a pause of 5 seconds. Another way is to add two separate pauses, one for the duration of the transition, and then another for the pause you want. It's up to you.

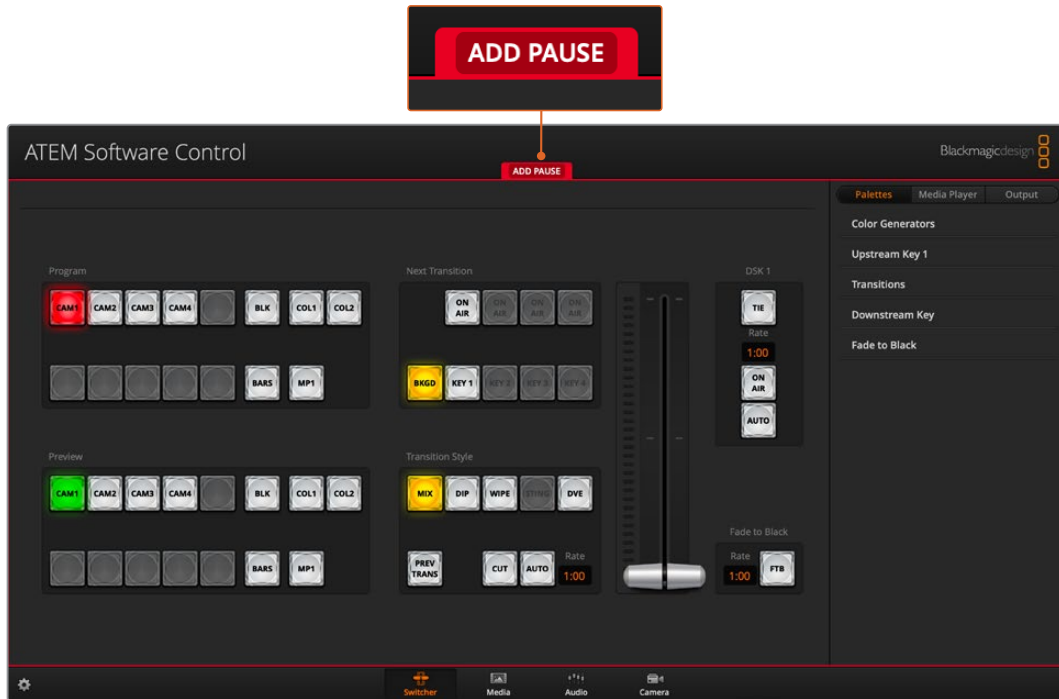

- 12 Now select black on the preview panel, and click the auto button in the transition style panel. Your ATEM switcher will perform a mix transition to black.
- 13 Click the record icon in the macros window to stop recording your macro.

The macro you just recorded will now appear as a button in your selected macro slot. To preview your macro, click the run button in the macros window to enter the run page. Select recall and run, which sets the macros window to run a macro as soon as you click on a macro button. Now click on your new macro button, named 'Transitions'.

- 14 If you want your macro to instantly run as soon as you select it, click on the 'recall and run' button. By enabling this feature you can load and play your macros with only one click of a button.

If your macro was successful, you should see your ATEM switcher perform a mix from color bars to color 1 using a 3 second transition, pause for 2 seconds, then perform another 3 second mix transition to black, all by clicking one button in the macros window! Your ATEM switcher will also display an orange border around your software control panel to indicate a macro is playing.

If your macro doesn't perform the way you expect it to, simply rerecord the macro you just created following the previous steps.

ATEM Software Control displays a red border to indicate when you are recording a macro. The 'add pause' button located at the top of the red border lets you enter durations for pauses between switcher actions.

Enter a name for your macro and a description so you can keep track of the switcher actions recorded in the macro.

The image shows how a macro button appears in the macros window after it has been recorded. To run a macro, click on the 'run' button to enter the run page. Now you can load and/or run the macro by clicking on the macro button.

Building Large Macros

Macros can even include triggering other macros as part of recording a macro. This lets you easily build larger macros from multiple smaller macros, i.e., recording macros with limited actions, then compiling them into a large macro. This is because if there are any mistakes while recording a large macro in one complete sequence, you'll need to go back to the start of your sequence and rerecord it. It's a lot easier to work with segments containing a small number of actions.

By recording a large macro using small macros, you can also edit your large macro by rerecording only the small macros you want to change, then compiling your small macros back into your large macro.

To compile small macros into a large macro:

- 1 Start recording a new macro, then while the macro is recording, click on the 'run' button to enter the run page.
- 2 Select 'recall and run' to automatically run macros at the push or click of a button, or deselect to load a macro and play it manually.
- 3 Run your sequence of small macros, with pauses between each one to cover the duration of each small macro, until you've completed the large macro.
- 4 Stop recording. You now have a complex, powerful large macro built from small macros you can easily change later if you need to.

There is no limit to the amount of actions you can perform. You can easily build complex transitions, create unique repeatable effects using keyers, or set up frequently used Blackmagic Studio Camera settings, graphic overlays and DVEs so you don't have to reconstruct them every time you start a new program. Macros are fun and will save you a lot of time!

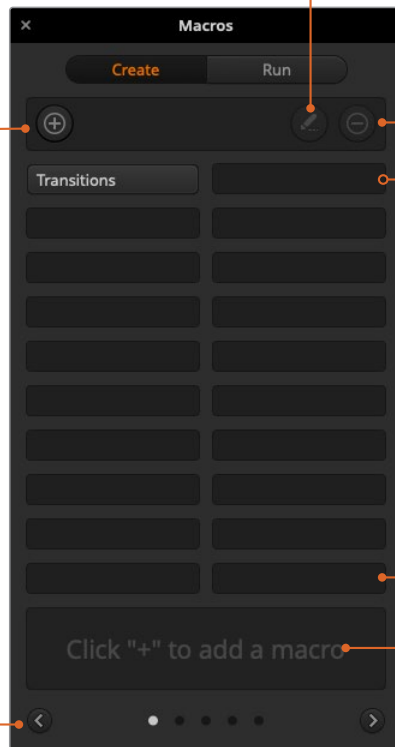

Macros Window Create Page

Create macro button:

Click this button to open the create macro popup window. From here you can name a new macro to be recorded, write a description of your macro in the notes section, and click record to start recording your macro.

Arrow buttons and page icons:

To access or record more than 20 macros, simply click on the right arrow at the bottom corner of the macros window to open a new page of macros. To move to the previous page of macros, click on the left arrow. You can see which page of macros you are viewing by observing the page icons between the arrows.

Edit macro button:

First select the macro you want to edit, then click on the edit macro button to edit the name and description of the macro.

Delete macro button: Select the macro you want to delete, then click on the delete macro button to delete the selected macro.

Macro buttons:

After recording a macro to a selected macro slot, your macro will appear as a macro button. 20 macro buttons can be displayed on one page. If a macro is unnamed when recording, the number of the selected macro slot will be used.

Status window:

This window provides helpful prompts and status messages to help you get started recording and running your macros. When a macro is selected, it also displays any notes you have included.

Macros Window Run Page

Recall and Run:

Selecting the Recall and Run feature lets you instantly run a macro by clicking a macro button. Deselecting the Recall and Run feature lets you load a macro by clicking on your macro button. Run the macro by clicking the play button.

Play:

When Recall and Run is deselected and you have loaded a macro by clicking on a macro button, click the play icon to start playing the macro.

Stop:

Clicking the stop button will stop the playback of a macro, but will complete the current action first. For example, if you press stop half way into a transition, the switcher will finish the transition and then stop.

Loop:

When the loop button is selected and you run a macro, your macro will run continuously until you click the stop button. When loop is deselected, your macro will run until it is completed.

Changing Switcher Settings

Clicking on the switcher settings 'gear' icon will open the settings window where you can change general switcher settings, audio, label, HyperDeck and remote settings. These settings are divided into tabs. If you are using ATEM Mini Pro, you will also have a multiview settings tab.

Changing switcher settings

General Settings

Setting the Switcher Video Standard

The video setting is used to select the operating video standard of your ATEM Mini. The video standard is set automatically when you plug in the first HDMI source, however if you ever need to change the video standard you can use this setting to do that. All video sources will then be converted to match the set video standard.

If you want to return ATEM Mini to automatically detect the first connected video format, select 'auto mode'.

Set video standard

To set the video standard, select the format you want to use from the 'set video standard to' drop down menu, and then click on the set button. Any time the video standard is changed, the switcher will remove any stills you have loaded into the media pool, so it's best to set the video standard before loading any media.

Supported Video Input Standards

1080p59.94
1080p50
1080p29.97
1080p25
1080p24
1080p23.98
720p59.94
720p50

Setting Audio Input and Output Behaviour

The 'audio' tab lets you control the nature of the audio follow video feature plus set the mic inputs to mic or line level audio. Microphones typically have weaker signals compared to line outputs from other audio devices. This means when mic is selected, the input is boosted slightly to compensate. This also means that if mic is accidentally selected when a line level input is plugged in, the audio will sound unusually loud. If the audio sounds much louder than it should be, check that line is selected instead of mic.

Audio Follow Video Behaviour

You can change the nature of the audio follow video feature for when switching sources. For example, select 'hard cut audio when switching' to allow the the audio from an input to switch immediately to another. If you want to the audio to smoothly transition over a brief period of time, select 'add a transition to audio when switching'.

Split Audio

Split a mono input signal into two separate mono channels. This is helpful for mixing a mono input into both channels on the stereo master output. You can also add a stereo simulation effect using the advanced Fairlight controls on the audio page.

Click on the desired input checkbox to split the channels for that input.

Multiview Settings

If you are using ATEM Mini Pro, the multiview settings allow you to set the multiview orientation. You can swap the position of the multiview preview and program views by clicking on the toggle button located between them.

The multiview settings also include the option to turn the safe area indicators inside the views on or off. Simply click on the safe area icon in the preview window.

Audio meters can be turned on or off for all the switcher sources and program view by enabling the 'all on' button in the multiview settings, or you can turn them on or off individually by clicking the audio meter icon in each view. The opacity of the audio meters can be adjusted by dragging the opacity slider left or right.

The multiview also includes a tally feature, so if any of the sources in the multi view are used in a layer on the program or preview outputs, they will be highlighted red or green. A white border means your source is not currently on the preview output, or on air on the program output. A red border indicates the source is used on the program output and a green border indicates a source is selected on the preview output.

The preview window on the multi view output features safe area markers so you can make sure your program will look great on any monitor. The outer border represents the 16:9 graphics safe area and the inner border represents the 4:3 graphics safe area.

Customizing the multiview

Labels Settings

Label settings

The input labels settings let you customize the name of each input using a long and short name. The short name will appear on the switcher input buttons on the software panel. The short 4 character name is used to identify the video input on the source names display. The longer input names support up to 20 characters and are displayed in various dropdown source selection boxes on the software control panel and on the ATEM advanced panel displays.

To change an input name, click in the text field, enter the text and click 'save'. The input name will be updated on the software control panel and external hardware panel if one is connected. It's a very good idea to change both the short and long labels at the same time, so they match. For example Camera 1 would be entered in as a long label, and CAM1 as the short label.

HyperDeck Settings

HyperDeck settings

You can connect up to 4 Blackmagic HyperDeck Studio disk recorders to a network via Ethernet and control them using ATEM Software Control. When connecting HyperDecks, use these settings to configure the IP Address, select the inputs your HyperDecks are connected to, turn the auto roll feature for each deck on or off, and set their frame offset settings so they can switch cleanly.

Status indicators appear above and below each deck so you can easily see if they are successfully connected and if their remote buttons are active.

For detailed information on setting up Blackmagic HyperDecks with your ATEM switcher and setting the 'HyperDeck' configuration settings, refer to the 'HyperDeck control' section of this manual.

Setting the HDMI Output Source

The HDMI output can have various sources routed to it. For example all video inputs, program, preview, plus camera 1 direct for a low latency loop output when gaming.

ATEM Mini Pro also has a powerful multiview feature which is the default HDMI output source. The multiview lets you monitor all your input sources and outputs on one single screen. You can read more about the multiview in the 'additional features on ATEM Mini Pro' section.

HDMI output control menu on Mac OS

To set the HDMI output, simply click on the 'output' option in the menu bar, then scroll the list for the source you want to output. When selected, the HDMI output will change immediately. You can see the current source with a tick in the menu item.

Program/Preview and A/B Direct Transition Control

When you first receive your ATEM switcher, it will be set to program/preview switching which is the current standard for mix/effects switchers. You can change this preference to A/B Direct if you wish to use legacy A/B switching. You'll find the 'transition control' options in the preferences window of ATEM Software Control.

Saving and Restoring Switcher Settings

ATEM Software Control lets you save and restore specific settings, or all of the switcher settings you have created. This powerful feature is incredibly time saving on live productions where regular settings are used. For example, you can immediately restore saved picture in picture settings, lower third graphics and detailed key setups from a laptop or USB drive.

Saving settings menu.

Saving your Settings

- 1 Go to the menu bar in ATEM Software Control and select File>Save As.
- 2 A window will open asking for a file name and destination folder. After you have made your selection, click Save.
- 3 You'll now see the Save Switcher State panel containing checkboxes for all the available settings on each block of your ATEM switcher. The Select All checkbox is enabled by default. If you save with Select All enabled, ATEM Software Control saves your entire switcher settings. If you want to choose specific settings to save, you can deselect settings individually, or to remove all settings click Select All once to deselect them. Now you can select specific settings you want to save.
- 4 Click Save.

ATEM Software Control saves your settings as an XML file together with a folder for ATEM media pool contents.

With ATEM Software Control you can save and restore all your switcher settings for your live production, including key settings, transition styles, media pool contents and more

After you have saved your settings you can quick save at any time by selecting File>Save, or by pressing Command S for Mac, or Ctrl S for Windows. Doing so will not overwrite your previous save, but will add a new XML file to your destination folder which is clearly identified with a time and date stamp. This means you can always restore a previous save if necessary.

Restoring your Settings

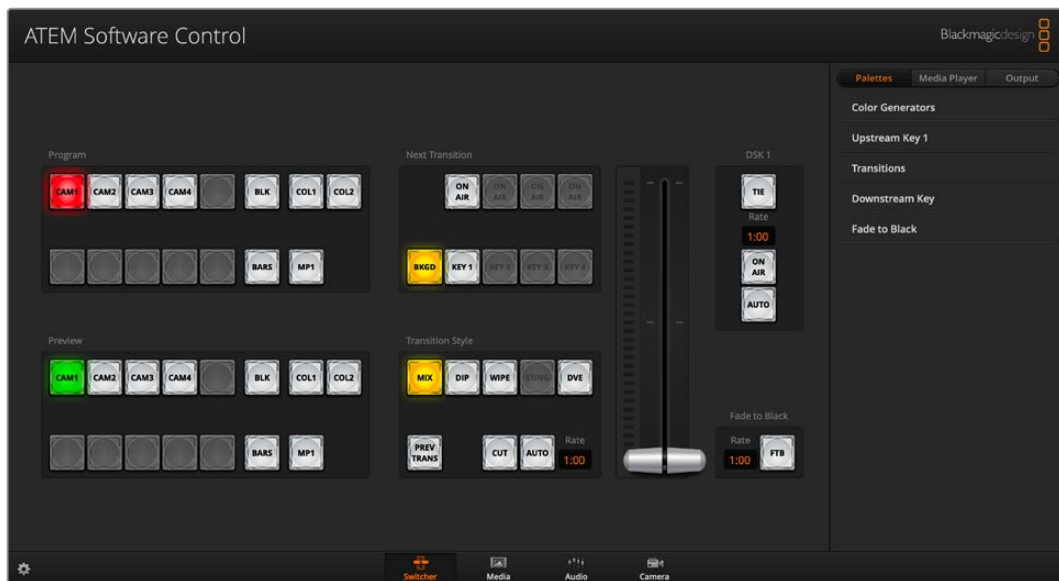

- 1 Go to the menu bar in ATEM Software Control and select File>Restore.
- 2 A window will ask for the file you want to open. Select your save file and click 'restore'.
- 3 You'll now see a window containing active checkboxes for your saved settings on each block of your ATEM switcher. Leave Select All enabled to restore all your saved settings, or select only the checkboxes for the settings you want to restore.
- 4 Click Restore.

If your switcher settings are saved on a laptop, it's easy to take all your settings with you on location. Connect your laptop to any ATEM switcher and quickly restore your switcher settings.

Live production can be a busy and exciting time and you're always working in the moment, which means you can easily forget to back up your saved files when the production is over. If you have settings you want to keep, save them to your computer and an external drive, such as a USB drive. This means you can carry your settings with you and have a back up in case your settings are accidentally deleted on your computer.

Saving your Startup State

If you have your switcher set up the way you want it, you can easily save your entire switcher state as your default startup state. Go to the 'file' menu in ATEM Software Control and select 'save startup state'. Now whenever you restart your switcher, it will start up with your saved settings by default. If you want to clear the startup state and revert to the factory settings on restart, go to the 'file' menu and select 'clear startup state'.

Saving your switcher settings on a laptop gives you the portability to restore your settings on any ATEM switcher. Saving to a USB drive means you can even carry your settings in your pocket.

Preference Settings

The preferences settings are arranged as 'general' preferences and 'mapping' preferences. The general preferences contain network settings, transition control and language selection options.

General Preferences

ATEM Software Control can be set to display in English, German, Spanish, French, Italian, Japanese, Korean, Portuguese, Russian, Turkish and simplified Chinese languages.

When running ATEM Software Control for the first time after installation, a setup dialog box will prompt you to set the language for the software, but you can change the language of the software at any time.

To change the language:

- 1 Go to the menu bar at the top of your screen, select 'ATEM Software Control' and open the 'preferences'.
- 2 Select your desired language from the drop down menu in the 'Software Control Language' in general settings.

A warning will appear asking you to confirm the action. Click 'change'.

ATEM Software control will now close and restart in your selected language.

You can change the language for ATEM Software Control in the ATEM Software Control preferences.

Button Mapping

In the mapping preferences, you can assign inputs to specific buttons on the preview and program rows.

ATEM Software Control and external ATEM hardware panels support button mapping so you can assign sources to different buttons. For example, occasional sources can be assigned to less prominent buttons. Button mapping is set independently for each control panel so button mapping set on a software control panel will not affect the button mapping set on a hardware control panel.

You can assign important cameras to more prominent buttons

Using Keyboard Hot Keys

Hot keys can be used allowing convenient control of some switcher functions using a standard QWERTY keyboard as shown in the following table:

Hot Keys	Function
<1> - <0>	Previews source on switcher Inputs 1 - 10. 0 = input 10.
<Shift> <1> - <0>	Previews source on switcher Inputs 11 - 20. Shift 0 = input 20.
<Control> <1> - <0>	Hot switches source on switcher Inputs 1 - 10 to Program output
Press and release <Control>, then <1> - <0>	Hot switches source on switcher Inputs 1 - 10 to Program output. Hot switching remains on and the CUT button is lit red.
<Control> <Shift> <1> - <0>	Hot switches source on switcher Inputs 11 - 20 to Program output
Press and release <Control>, then <Shift> <1> - <0>	Hot switches source on switcher Inputs 11 - 20 to Program output. Hot switching remains on and the CUT button is lit red.
<Control>	Turns off hot switching if currently on. The CUT button is lit white.
<Space>	CUT
<Return> or <Enter>	AUTO

ATEM Mini Setup Settings

When ATEM Software Control is installed on your computer, a setup utility called ATEM Setup will also be installed. This setup utility lets you update your ATEM Mini, name the unit, change network settings and provides panel settings including program preview and cut bus switching modes, plus keyer related switching settings.

TIP For information on how to change network settings, refer to the 'connecting to a network' section.

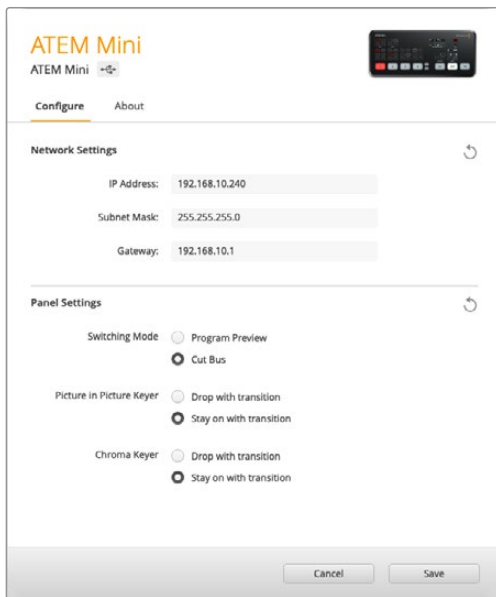

Updating your ATEM Mini

To update your ATEM Mini, simply connect the unit to your computer via USB or Ethernet. Launch ATEM Setup. If the software version installed on your computer is newer than the version installed on your ATEM Mini, a dialogue box will appear notifying you of an update. Simply click on the 'update' button and follow the prompts to update the unit.

A progress bar will appear with a notification to let you know when the update is complete.

Configure Page

Panel Settings

Switching Mode

This setting lets you set ATEM Mini to use program preview or cut bus switching modes. Refer to the 'Switching Modes' section for more information.

Picture in Picture Keyer

This setting lets you choose to keep the picture in picture on screen indefinitely so you can switch content underneath it, or tie it to the next transition so when you perform the transition, picture in picture will transition off screen with it.

Drop with Transition	Ties picture in picture to the next transition and will transition off screen when the next transition is performed.
Stay on with transition	Holds picture in picture on air so you can switch sources without affecting picture in picture.

TIP Drop with transition lets you smoothly turn off picture in picture by linking it with the transition, however you can always turn picture in picture off at any time by pressing the respective off button on the control panel.

Chroma Keyer

These settings are similar to the picture in picture keyer setting, however it applies to the upstream keyer.

Drop with Transition	Ties the upstream chroma keyer to the next transition and will transition off screen when the next transition is performed.
Stay on with transition	Holds the upstream chroma keyer on air so you can switch sources without affecting the chroma key.

About Page

The about page tells you which version of ATEM software is installed on your computer.

To change the name of your ATEM Mini, click in the 'label' edit box, type in a new name and click 'save'

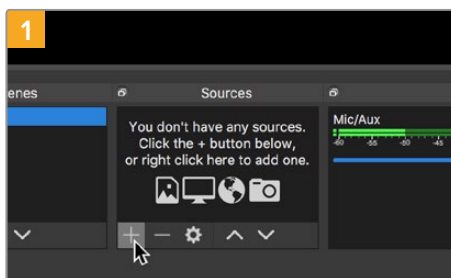

Setting up Open Broadcaster

Even though the ATEM Mini Pro model can stream directly using its Ethernet connection, if you want to stream using an external computer then you can connect the USB-C and it will appear as a webcam on your computer. This then lets you use streaming software such as Open Broadcaster for streaming.

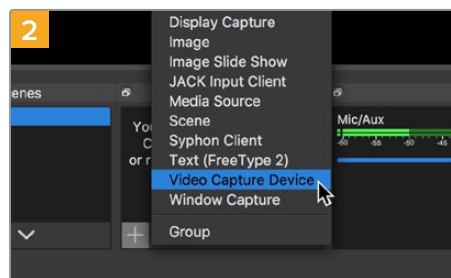

This section shows how to use Open Broadcaster to stream via the USB-C webcam output.

Open Broadcaster is an open source application that works as a streaming platform between your ATEM Mini and your favorite streaming software like YouTube, Twitch, Facebook Live, Vimeo Live and others. Open Broadcaster compresses your video to a bit rate that is easily managed by your streaming app.

Below is a demonstration of how to set up Open Broadcaster to stream the webcam output from your ATEM Mini using YouTube as the streaming application.

Launch Open Broadcaster and click on the plus symbol in the 'sources' box.

Select 'Video Capture Device'.

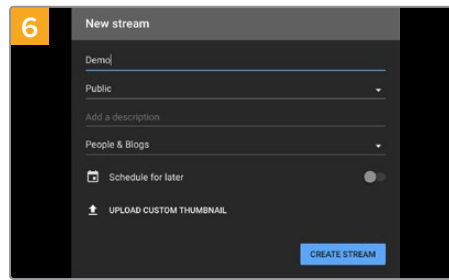

Name the new source and click 'OK'.

In the device drop down menu, select Blackmagic Design and click 'OK'.

Now go to your YouTube account. Navigate to the 'video/live' option and click 'get started'.

In the YouTube 'stream' options, enter your broadcast details and click 'create stream'.

YouTube will now generate a stream name/ key that will direct Open Broadcaster to your YouTube account.

Click the 'copy' button next to the stream key. Copy the stream key that you will now paste into Open Broadcaster.

Return to Open Broadcaster and open the preferences by clicking on 'OBS/preferences' in the menu bar. Select 'stream'. Now paste in the stream key you copied from YouTube and click 'OK'.

You will now see the video from your ATEM Mini in the Open Broadcaster streaming preview window.

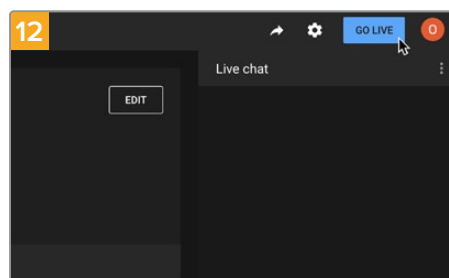

To connect Open Broadcaster's broadcast link to YouTube, click 'start streaming' in the bottom right corner of the screen. This establishes the link to YouTube from Open Broadcaster and from here everything will now be set using YouTube Live.

Go back to YouTube Live and you will see the webcam program output from your ATEM Mini in the background. Click 'done'.

With Open Broadcaster now communicating with YouTube Live, you are ready to begin your broadcast. Now it's time to perform your final checks and make sure everything is good.

If you are all set, you can now begin your broadcast by clicking 'go live'.

You are now broadcasting live on YouTube with Open Broadcaster. When your broadcast is finished and you have pressed the fade to black button on ATEM Mini, you can end the stream by clicking 'end stream'.

NOTE Due to the nature of internet streaming there can often be a delay, so it's important to watch the stream on YouTube and confirm your program has finished before clicking 'end stream' to make sure you don't accidentally cut the end of your broadcast short.

Using Adobe Photoshop with ATEM

Installing the ATEM software on your computer also installs a Photoshop plug-in that lets you upload Photoshop graphics direct to the ATEM Mini's media pool.

The plug-in connects to your computer via Ethernet the same way as any other computer running ATEM Software Control on your network. For example, another operator can be updating graphics live in Photoshop during your production and uploading them straight to ATEM's media player using the plug-in.

This means you can accept graphics from designers in the application that 100% of the world's designers use, Adobe Photoshop! You can even use the layers in a Photoshop image to keep variations of graphics, such as different titles in a graphic, and then select the layers in Photoshop you want, and then simply upload them at the press of a button. When uploading the layers are automatically flattened in real time before upload. This happens in the background and your document in Photoshop is unchanged by the export.

The ATEM export plug-in requires Adobe Photoshop CS5 or later. Install or reinstall the ATEM software after Photoshop is installed, to ensure the ATEM export plug-in is installed.

TIP If you are not streaming via ATEM Mini's USB webcam output, but switching content over the HDMI output instead, you can upload graphics from the Photoshop plug-in via USB. However, due to the way USB establishes a connection to a single client only, you will need to close ATEM Software Control so the Photoshop plugin can access the USB connection, upload your graphics, then relaunch ATEM Software Control to access the media pool.

ATEM export plug-in

Setting up Plug-in Switcher Location

The first time the Photoshop export plug-in is run, it will ask you to select your switcher location. This is the IP address of the switcher so the plug-in can find the switcher to communicate with. By default, the IP is set to 192.168.10.240, which is what the switcher IP address is originally set to when first sold. If you want to export several versions of the same Photoshop file, you can use the export plug-in window to name each exported file and also choose whether to set the files to a media player after export.

Preparing Graphics for Upload

For best results, you will want to use a Photoshop document resolution that matches the video standard you're using with your ATEM switcher. For 1080 HD you should use 1920 x 1080 pixels in resolution. For 720p HD formats you should use 1280 x 720 pixels.

When working with Photoshop documents for ATEM, you should not put any content on the background layer, but add all content to the layers above. The background layer should always be plain full frame black, and you should use a pre-multiplied key setting in the ATEM keyer for keying graphics from Photoshop.

Using Multiple Control Panels

ATEM Mini and ATEM Mini Pro have multiple ways they can be controlled and you can use this software control panel as well as a range of hardware control panels. In fact, if you connect your ATEM Mini to a network that has other computers connected, you can run multiple copies of this software control panel. This means you could have someone operating the switcher, while someone else could be controlling cameras, managing media or mixing audio. It's quite flexible and this means many people can be operating your ATEM Mini all at the same time!

A good example is the relationship between the software control panel, external ATEM hardware control panel and the control panel of ATEM Mini. The software control panel has been designed to be the same as the external ATEM hardware control panel. This is a convention and well understood ME style of layout where you have a program row and preview row of input controls and then a transition block that lets you command the transition.

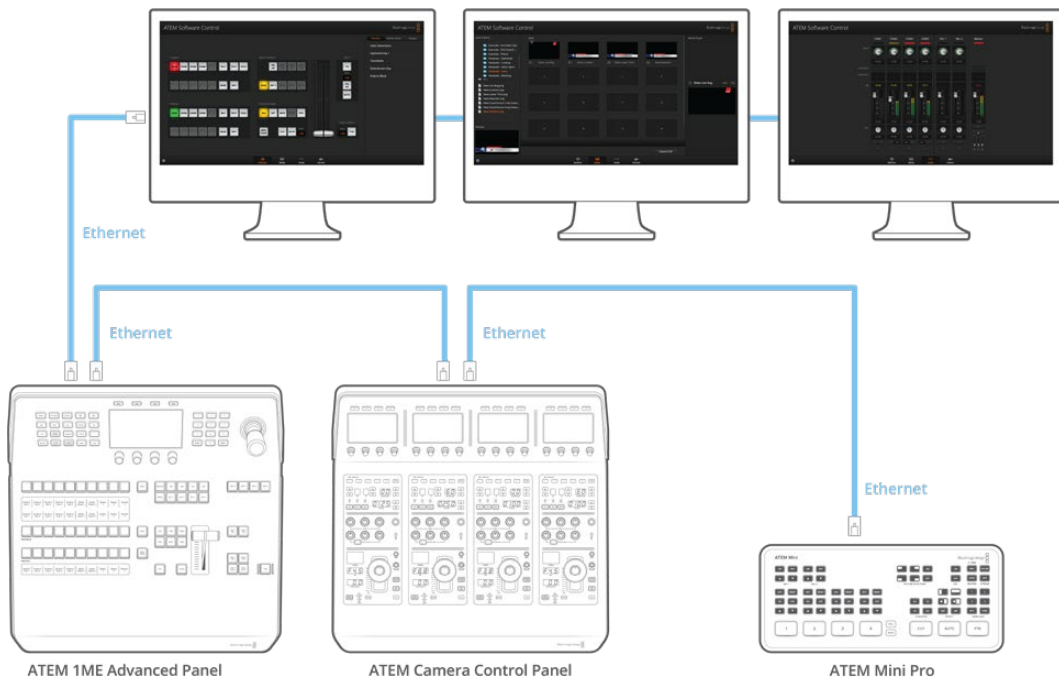

If you plug in both control panels, you can see them mirror each other and any button pressed on one control panel will be reflected on the other control panels instantly.

However, due to space limitations the control panel of ATEM Mini is a little bit different and it's interesting to see the relationship between how this control panel works and how the software control panel works. A good way to understand this is to watch ATEM Mini's panel control while controlling the switcher via the software control panel.

Because of the limited space on ATEM Mini's control panel, both the program and preview rows have been combined together into a single row of buttons. When running ATEM Mini in program preview switching mode, you can see the source selected on the program row because it's illuminated red and the source selected on the preview row because it's selected green. These are the same colors as the software control panel, but they are just on the same row of physical buttons.

The following section describes how to connect your ATEM equipment to a network so you can operate your switcher using an ATEM hardware panel and multiple computers running ATEM Software Control.

TIP If you are using 4 Blackmagic Pocket Cinema Camera 4Ks or 6Ks with ATEM Mini, you can even connect an ATEM Camera Control Panel and control all 4 cameras via HDMI using an external hardware control panel.

When connected to a network via Ethernet, multiple computers can run ATEM Software Control simultaneously, which means multiple operators can be dedicated to separate controls on your ATEM Mini. For example, multiple operators can control media management, camera control and audio mixing.

TIP For detailed information about how to control your ATEM Mini using ATEM 1 M/E Advanced Panel refer to the 'using the ATEM 1 M/E Advanced Panel' section.

Connecting to a Network

Most people simply plug their computer and control panel direct to the switcher, however in some situations it can be very powerful to connect via your network!

Your ATEM Mini ships from the factory with settings to allow hardware control panels to simply be connected directly with an Ethernet cable. However your ATEM supports full Ethernet IP protocols so you can place your ATEM Mini and external ATEM control panel on your network or anywhere on the planet using the internet. Connecting to a network means you have enormous flexibility with how you control your switcher. For example, you can connect an ATEM 1 M/E Advanced Panel on the same network to ATEM Mini and have two operators switching content. In addition, you also have the software panel on your computer so you can even have a third operator handling audio, or managing media from the software panel.

However, it's worth noting that if you use your ATEM Mini on a network, then you're also increasing the complexity of the connection between your control panel and the switcher, so there is possibly a greater chance of something going wrong. ATEM Mini can also be used when plugged into a switch, and even via most VPNs and over the internet.

Connect ATEM Mini to a network and then you can operate your switcher using ATEM Software Control on any computer connected to the same network

Using DHCP and Fixed IP Addresses

ATEM Mini connects to ATEM hardware panels and your network using a fixed IP address which is set to a default address during manufacture. ATEM Mini Pro and ATEM hardware panels can use a fixed IP address or DHCP.

DHCP

The dynamic host configuration protocol, or DHCP, is a service on network servers that automatically finds your ATEM Mini Pro and assigns an IP address. The DHCP is a great service that makes it easy to connect equipment via Ethernet and ensure their IP addresses do not conflict with each other. Most computers and network switchers support DHCP.

Fixed IP Address

All ATEM hardware panels and ATEM switchers except ATEM Mini Pro have a default fixed IP address. This is a determined IP address that is set in the unit when manufactured. When connecting an ATEM Mini directly to an ATEM hardware panel, for example ATEM 1 M/E Advanced Panel, the fixed IP addresses let the two units communicate with each other straight away.

NOTE ATEM Mini Pro is slightly different as it doesn't have a set IP address. That is because ATEM Mini Pro is designed to use the dynamic host configuration protocol and has DHCP set as the default IP setting. Once the DHCP has assigned the unit an IP address, you can see this address in Blackmagic ATEM Setup's network settings. This is helpful when you are connecting an ATEM hardware panel to an ATEM Mini Pro so you can tell the hardware panel the switcher's assigned IP address.

If your network doesn't support DHCP, you can change the network settings manually.

Manually Setting a Fixed IP Address

When setting IP addresses manually so all units can communicate, they must share the same subnet mask and gateway settings. In addition, the first three fields of numbers in the panel's IP address also need to match. For example, ATEM Mini's default IP address is 192.168.10.240 and an external ATEM 1 M/E Advanced Panel's default IP address is factory set to 192.168.10.60. This means both units share the first three fields of numbers, but have their own identifying number in the last field so they won't conflict with each other.

This is generally the most important principle to know when working via Ethernet.

Below is an example of fixed IP address settings when ATEM Mini is connected directly to ATEM 1 M/E Advanced Panel.

ATEM Mini IP Settings

IP Address - 192.168.10.240
Subnet Mask - 255.255.255.0
Gateway - 192.168.10.1

ATEM 1 M/E Advanced Panel IP Settings

IP Address - 192.168.10.60
Subnet Mask - 255.255.255.0
Gateway - 192.168.10.1

Notice that all the numbers are the same except for the last field of each IP address. This means they are set correctly and the units will communicate with each other without conflicts.

When connecting to a network, the network will have its own subnet mask, gateway, and IP address settings which every connected device will conform to. You will need to make sure both your ATEM Mini and the ATEM 1 M/E Advanced Panel share those numbers and similarly with regards to the IP address, have their own identifying number in the last field so they won't conflict with each other.

Below is an example showing ATEM Mini and an ATEM 1 M/E Advanced Panel set to conform to a network using a fixed IP address.

Network IP Settings

IP Address - 192.168.26.30
Subnet Mask - 255.255.255.0
Gateway - 192.168.26.250

ATEM Mini IP Settings

IP Address - 192.168.26.35
Subnet Mask - 255.255.255.0
Gateway - 192.168.26.250

ATEM External Hardware Panel IP Settings

IP Address - 192.168.26.40

Subnet Mask - 255.255.255.0

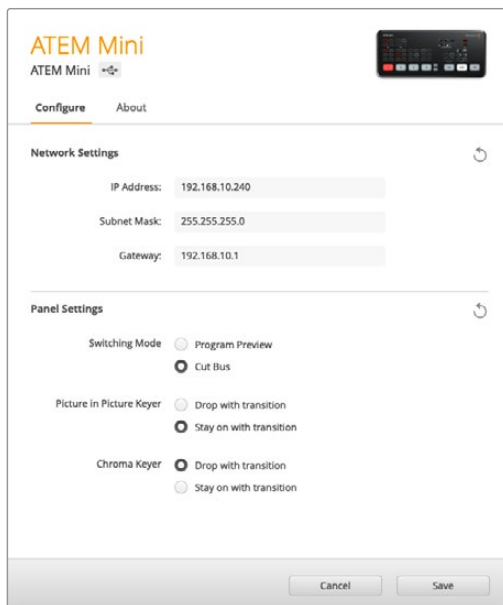

Gateway - 192.168.26.250

If there are other devices on the network that have the same identifying number in their IP address, there will be a conflict and the units won't connect. If you encounter a conflict, simply change the identifying number in the unit's IP address. Refer to the next sections for information on how to change network settings.

NOTE If ATEM 1 M/E Advanced Panel is not connecting to your ATEM Mini and displays a message saying it is looking for the switcher, you will need to tell the panel where your switcher is on the network. This is simply typing your ATEM Mini's IP address into the panel's switcher IP settings. Refer to the next sections for information on how to set the switcher IP location on ATEM 1 M/E Advanced Panel.

Changing ATEM Mini Network Settings

ATEM Mini's network settings are changed using Blackmagic ATEM Setup via USB. Please follow the steps below:

Change network settings using the 'configure' tab in Blackmagic ATEM Setup.

To change the network settings via Blackmagic ATEM Setup:

- 1 Connect ATEM Mini via USB to the computer running the setup utility software.
- 2 Launch Blackmagic ATEM Setup and select your ATEM Mini.
- 3 ATEM Mini's current IP address, subnet mask and gateway settings will be displayed in 'configure' window. If you only want to check the IP address and not change it, you can simply quit the setup utility by clicking 'cancel'.
- 4 To change the IP address or any other settings, edit the numbers and then click 'save'.

Changing the Hardware Panel Network Settings

Because ATEM 1 M/E Advanced Panel is also on the network and communicating with the switcher, it also has network settings so it can connect to the network. These settings are different to the switcher IP address, which is just where the panel is looking to find the switcher. The panel network settings can be changed by following the steps below:

Changing Network Settings on ATEM 1 M/E Advanced Panel

Change network settings using the system control buttons and LCD soft controls

- 1 Press the 'home' button in the system control buttons to open the LCD home menu.
- 2 In the home menu, press the 'network' soft button to open the network settings.
- 3 The next step is to decide if you want the panel to use a fixed IP address or to be automatically assigned an IP address from a DHCP server. Set DHCP on or off by pressing the corresponding DHCP ON/OFF soft button.

NOTE If you're connecting direct to a switcher without a network, then you won't have a DHCP server to assign an IP address automatically, so you will want to select 'DHCP off'. ATEM 1 M/E Advanced Panel is delivered with a fixed IP address set to 192.168.10.60 for a direct connection.

However, if your network has lots of computers that automatically assign IP addresses via DHCP, then you can also select 'DHCP on' so the panel can get its network information automatically. This is possible on the panel, and it's only ATEM Mini that always requires a fixed IP, as the switcher needs to be found by the control panels at a known fixed address on your network.

ATEM Mini Pro is set to use DHCP by default, so if you are connecting an ATEM hardware panel and ATEM Mini Pro to a network that supports DHCP, you can set the panel to 'DHCP on' and your network settings will be complete because the panel network settings will be obtained from the network automatically.

- 4 If you have elected to use a fixed IP address, you now need to set this IP address by adjusting the corresponding soft control knobs for each field of the IP address. You can also use the numeric keypad. Changing this IP address may cause the panel to lose communication.
- 5 If the subnet mask and gateway address need to be set, then press the right arrow button in the system control buttons to progress through each setting menu, and use the knobs or the numeric keypad to edit. If at any time you want to cancel the changes, press 'undo'.
- 6 When you are happy with your settings, press the 'save changes' soft button to confirm.

When you are happy with your network settings, press the 'save changes' button to confirm them

Setting the Switcher's IP Location on the Panel

To set ATEM Mini's IP location on ATEM 1 M/E Advanced Panel so the panel can find ATEM Mini and communicate, simply follow these steps:

Changing the Switcher's IP location on ATEM 1 M/E Advanced Panel

- 1 When there is no communication with ATEM Mini, the LCD will say 'connecting' and notify you of the IP address it is searching for. If the panel can't find the switcher, the connection will time out and a notification will ask you to check the IP address. Press the 'network' soft button above the LCD to open the network settings.
- 2 In the network settings, press the right arrow in the system control buttons next to the LCD to move to the 'switcher IP address' setting.
- 3 Now use the corresponding LCD soft control knobs to set the correct IP address for your switcher.
- 4 Press the 'save changes' soft button to confirm the setting.

Your panel will now connect with your switcher.

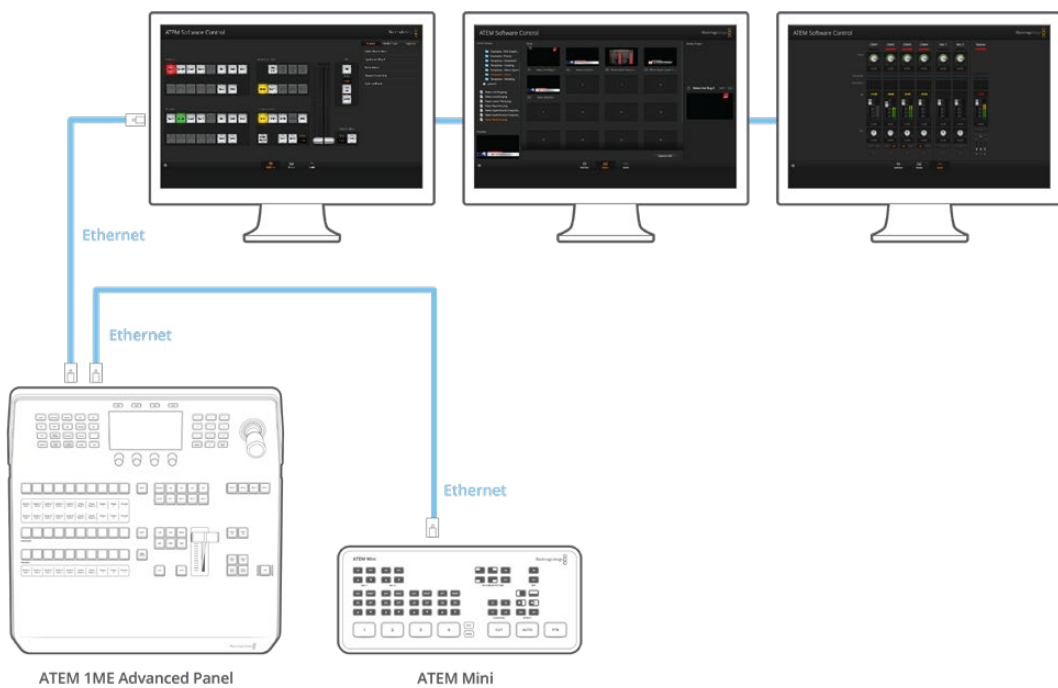

On the ATEM 1 M/E Advanced Panel, press the 'network' LCD soft button to open the network settings on the LCD, then use the system control arrow buttons to navigate to the switcher IP address setting. Use the soft controls to set the network IP address for your switcher, and don't forget to save the changes.

NOTE Changing the switcher IP address on your panel does not change the IP address of ATEM Mini itself. It just changes where the control panel is looking to find the switcher.

ATEM Software Control via the Network

Lastly, if you want to use ATEM Software Control as well as an ATEM 1 M/E Advanced Panel, you need to ensure your computer is connected and working on your network. Once launched, if ATEM Software Control cannot communicate with ATEM Mini, you will be prompted automatically to select your ATEM Mini from the connected ATEMs list, or enter the unit's IP address manually. Once you have confirmed the switcher from the list or set the IP address, ATEM Software Control can find your switcher and communicate.

Multiple computers can run ATEM Software Control simultaneously, which means multiple operators can be dedicated to separate controls on your switcher, for example media management and audio mixing.

Connecting ATEM Mini Pro to an Internet Router

On ATEM Mini Pro, connecting to an internet router via Ethernet lets you stream your broadcast over Ethernet while using the USB-C connector to record to an external drive.

To set up direct streaming via Ethernet, first enter the stream details in ATEM Software Control. This will store the streaming information in ATEM Mini Pro.

- 1 In ATEM Software Control's processing palettes go to the 'output' settings and select your streaming platform from the drop down menu.
- 2 Enter the server closest to your location in the 'server' drop down menu, then enter your stream key in the 'key' setting. Refer to 'getting a stream key' in the next section for more information.
- 3 With the details entered into ATEM Software Control, now plug your ATEM Mini Pro into the internet router using a CAT 5 network cable. This is usually a wireless router that connects all your home or office devices to the internet. The unit will normally have additional Ethernet inputs and you can plug your ATEM Mini Pro directly into one of those.

TIP If your computer is connected to the internet router and has an Ethernet port, you can also connect ATEM Mini Pro to your computer via Ethernet and connect to the internet via your computer.

- 4 It's worth streaming a test to make sure everything is set correctly. You can do this by switching color bars, or a standby graphic in the media player to the program output and checking you can see it on your streaming platform.

Now if you are happy and ready to start, all you need to do is press 'on air' and you are broadcasting live!

NOTE Most internet routers support DHCP, but if yours does not, you can still connect by setting the network settings manually using Blackmagic ATEM Setup.

Getting a Stream Key

When setting up your stream, you will need a stream key. This is assigned to your broadcast by your streaming platform, for example YouTube Live, Facebook Live or Twitch.

In the following example you can see how to generate a stream key using FaceBook Live, YouTube Live and Twitch.

Facebook Live

- 1 Go to your Facebook page and click on 'create post'.
- 2 Select 'live video' from your create post options.
- 3 Click on the 'connect' tab.
- 4 Now click on 'use a persistent stream key'.

Facebook will now supply you with a stream key that will be assigned to your Facebook page. All you need to do is copy the stream key and paste it into the 'key' setting in ATEM Software Control's live stream options.

YouTube Live

- 1 Log into your YouTube account.
- 2 Click on the camera icon in the top right corner to create a video or post.
- 3 Select 'go live' from the drop down menu.
- 4 In the dialogue box, type in a title and add a description.
- 5 Click on 'create stream'.
- 6 Copy the stream key.

Now you can paste the stream key into ATEM Software Control's 'live stream' options which saves the key in your ATEM Mini Pro.

Twitch

- 1 Log into your Twitch account.
- 2 Click on your account avatar in the top right corner.
- 3 Click on 'creator dashboard'.
- 4 In the left hand menu, click 'preferences', then select 'channel'.
- 5 Click on the 'copy' button to copy the stream key.
- 6 Now paste the stream key into ATEM Software Control's 'live stream' options which saves the key in your ATEM Mini Pro.

For more detailed information about setting up streaming on a computer, refer to the 'direct streaming and switcher control via Ethernet' section earlier in the manual.

Keying using ATEM Mini

Keyers are a powerful production tool that allow the arrangement of visual elements from different sources on the same video image.

To do this, multiple layers of video or graphics are stacked on top of the background video. Altering the transparency of various parts of these layers allows the background layer to be visible. This process is called keying. Various techniques are used to create this selective transparency and these correspond to the different types of keyers available on your switcher.

The following section explains luma and linear keyers, which are available either upstream or downstream, and chroma, pattern and DVE keys, which are upstream keyers.

Understanding Keying

A key requires two video sources; the fill signal and the key or cut signal. The fill signal contains a video image which is to be stacked on top of the background, while the cut signal is used to select regions of the fill signal to be made transparent. The fill and cut signals can be selected from any of the switcher's external inputs or internal sources, allowing both still and moving images to be used as fill or cut sources.

Fill and cut signals are selected on the software control panel from drop down lists in the upstream and downstream key palettes. In your switcher's LCD menu, you can select fill and cut signals in the upstream or downstream key menus.

There are two types of keyers used in your switcher; upstream keyers and downstream keyers. One upstream keyer, also known as an effects keyer, plus two downstream keyers are available via the switcher's control panel and LCD menu, or via ATEM Software Control. The upstream keyer can be set up as a luma, linear, pre-multiplied, chroma, pattern or DVE key. Two downstream keyers are available in the dedicated DSK block. Each downstream keyer can be set up as a luma or linear key.

Luma Key

A luma key or self key consists of one video source containing the video image that will be stacked on top of the background. All of the black areas defined by the luminance in the video signal will be made transparent so that the background can be revealed underneath. Since only one image is used to define the areas to be cut out, a luma key uses the same signal for the fill and key. The following images are an example of what background, luma key signals and the resulting combined image might look like.

Combining a background and fill/key in a luma key

Background

A full screen image, often a camera source.

Fill

The graphic you plan to display on top of your background video. Notice that the final composition does not retain any black from the graphic because all of the black parts have been cut out of the image.

Linear Key

A linear key consists of two video sources, which are the fill signal and the key or cut signal. The fill signal contains a video image which is to be stacked on top of the background, while the key signal contains a grayscale mask that is used to define regions of the fill signal to be made transparent. Since both the fill and key signals are video inputs, both signals can be in motion while on screen. The following images are examples of what background, fill and key signals, and the resulting combined image might look like.

Combining a background, fill and key in a linear key

Background

A full screen image, often a camera source.

Fill

The graphic you plan to display on top of your background video. Notice that the black parts of the graphic remain intact because the key signal is used to determine the transparency of the fill signal. The fill signal is often provided by a graphics system.

Key

A grayscale image that defines the region in the image that will be removed so that the fill signal can be correctly stacked on top of the background. The key signal is often provided by a graphics system.

Pre multiplied Key

A modern graphics system or character generator that offers fill and key outputs will most likely provide what is known as a pre multiplied or shaped key. A pre multiplied key is a special combination of the fill and key signal where the fill signal has been pre multiplied with the key signal over a black background. Photoshop generated images that contain an alpha channel are pre multiplied.

ATEM switchers have an auto key adjustment for pre multiplied keys so that when the pre multiplied key setting is enabled, the clip and gain parameters are automatically set by the system.

When using a Photoshop generated image, generate graphics over a black background layer and place all content on the upper layers. Add an alpha channel in your Photoshop document that the ATEM can use for blending the graphic over the live video. Then, when saved as a Targa image file, or downloaded direct to the media pool, you can select pre multiplied in the keyer and you should have a great key!

Photoshop documents are pre multiplied by nature, so you should always use the pre multiplied settings on the ATEM switcher when keying them.

Performing an Upstream Luma/Linear Key

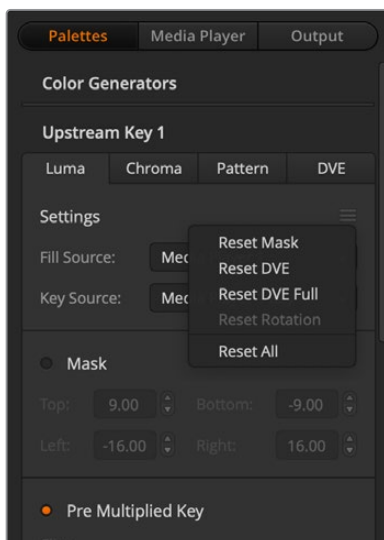

Since luma and linear keys use the same parameters, they are set up on the software control panel and advanced panel using a common menu, called the luma key menu. What defines the key as being either luma or linear is in the selection of fill and key sources. In a luma key, fill and key sources are the same. For a linear key, fill and key sources are different.

To set up a luma/linear key on the upstream keyer in ATEM Software Control:

- 1 Expand the upstream key 1 palette and select luma tab.
- 2 Select the fill source and key source.

If performing a luma key, select the same source for both fill and key.

Adjust the key parameters to refine the key. For a description of luma key parameters, refer to the table below.

Select sections of the Palette you wish to reset from the reset menu

Upstream key luma/linear key parameters:

Mask	Enables a rectangular mask that can then be adjusted using the top, bottom, left and right parameters.
Pre-Mult	Identifies the key signal as a pre-multiplied key.
Clip	The clip level adjusts the threshold at which the key cuts its hole. Decreasing the clip level reveals more of the background. If the background video is completely black then the clip value is too low.
Gain	The gain adjustment electronically modifies the angle between on and off thereby softening the edges of the key. Adjust the gain value until the edge softness is desirable but the background video luminance or brightness is not affected.
Invert Key	Inverts the key signal.
Flying Key	Enables/disables DVE effects.

Setting up a Luma/Linear Key on the Upstream Keyer using ATEM 1 M/E Advanced Panel

- 1 Press the 'key 1' button to enable the keyer on the preview output. This automatically selects the keyers menu on the system control LCD, but you can also press the 'keyers' button to enter the menu directly.
- 2 Select the desired M/E keyer by pressing the corresponding soft button along the top edge of the LCD menu.
- 3 Use the control knob underneath the 'key type' indicator to choose the 'luma' key.
- 4 Rotate the 'fill source' and 'key source' control knobs to choose a fill and key source. You can also press the corresponding buttons on the source select bus to select the fill and key source.
- 5 Once you have chosen a key type, fill and source, press the 'right' arrow button to scroll through to the next menu item and use the control knobs to adjust key parameters such as mask, gain, clip, enable or disable pre multiplied key, etc.

To set up a luma/linear key on downstream keyer in ATEM Software Control:

- 1 Select the downstream key 1 palette.
- 2 Use the drop down controls labeled fill source and key source to specify the fill and key sources. If performing a luma key, select the same source for both fill and key.
- 3 Adjust the key parameters to refine the key.

Downstream Keyer Settings

Setting up a Luma/Linear Key on the Downstream Keyer using ATEM 1 M/E Advanced Panel

- 1 Press the 'DSK 1 tie' button to enable the downstream keyer on the preview output. This automatically selects the downstream key menu on the system control LCD, but you can also press the 'keyers' button and press the right arrow to enter the menu directly.
- 2 Press the 'DSK 1' or 'DSK 2' soft button to select which downstream keyer you wish to use. You don't have to select the key type as the downstream keyer is always a luma key.
- 3 Use the control knobs under the LCD menu to select the fill source and key source. You can also use the corresponding source select buttons to select the fill and key source.
- 4 Once you have chosen the fill source and key source, use the 'left' and 'right' control buttons to scroll through additional menu screens containing key parameters such as mask, gain, clip, pre multiplied key settings, and more.

Chroma Key

Chroma key is commonly used for weather broadcasts, where the meteorologist appears to be standing in front of a large map. In the studio the presenter is actually standing in front of a blue or green background. In a chroma key two images are combined using a special technique and a color from one image is removed, revealing another image behind it. This technique is also referred to as color keying, color-separation overlay, green screen, or blue screen.

A very common use for chroma keys for backgrounds is computer generated graphics. It's simple to connect an external computer to your ATEM switcher using the HDMI output of the computer or a video card such as the Blackmagic Design DeckLink or Intensity range and then play back video clips to your ATEM switcher. If you render a green background on your animations, you can then key this green to create fast and clean animations of any length. Keying is easy as the green is computer generated so it's a very flat color that's easy to key.

Combining a background with a fill and chroma key mask

Background

A full screen image; in the case of a chroma key it is often a weather map.

Fill

The image you plan to display on top of your background video. In the case of a chroma key, this is video of the meteorologist in front of the green screen.

Key/Cut

In the case of a chroma key the key/cut signal is generated from the fill signal.

Performing a Chroma Key

ATEM Mini features an advanced chroma keyer with detailed chroma sampling and adjustment options. These controls help you achieve the best key, improving the blend of foreground and background so you can create a more convincing visual effect.

To set up a convincing chroma key using the advanced keyer:

- 1 In ATEM Software Control, expand the upstream key palette and select 'chroma' from the key types bar.
- 2 Select the fill source. Typically, this source would be from a camera facing a presenter in front of a green screen, or a graphic loaded in a media player.
- 3 Click the 'chroma sample' button. With the chroma sample selected, you'll see a new panel appear with a box cursor. This cursor is also visible on the preview output.
- 4 Click and drag on the box cursor to move it to the position you want to sample.

The chroma sample setting lets you position a cursor over the screen area you want to sample

Choose a representative area of your green screen that covers as much of the luminance range of the screen as possible. The default size of the box cursor is well suited to most green screens that are relatively evenly lit, however if there is a lot of variance in your green screen, you can adjust the size of the box by clicking on the slider to the right of the sample window and dragging it up or down.

TIP When sampling uneven green screens, we recommend sampling the darkest area first before increasing the size of the sample box. This can give you a more accurate key.

NOTE You can preview your key on the preview output via HDMI at any time by clicking the 'preview' button above the chroma sample panel. This shows you the final composited version of your chroma key effect on the preview.

Click the preview button to check the final composite on the preview output

Fine Tuning your Key using Key Adjustments

Once you have achieved a good chroma sample that removes most of your green screen while generally retaining foreground elements, its time fine tune your key with the 'key adjustments' controls.

Foreground

Use the 'foreground' slider to adjust how opaque the foreground mask is. This determines the strength of the foreground against the background. By increasing the slider, you can fill in any small areas of transparency inside your foreground image. We recommend moving this slider and stopping as soon as the foreground becomes solid.

Background

The 'background' slider adjusts the opacity of the keyed area. Use this slider to fill in any small foreground artifacts left over in the area of the image you want to remove. We recommend moving the slider until your keyed area is consistently opaque.

Key Edge

The "key edge" slider moves the edge of your keyed area in or out, helping to remove background elements from the very edge of your foreground or extending the foreground out a little if your key is too aggressive. This can be especially useful with fine details like hair. We recommend moving this slider until the edge of your key is generally clean, without any background artifacts visible.

Using the key adjustment controls, your foreground elements should be cleanly separated from the background.

Chroma Correction using Color Spill and Flare Suppression

Light bouncing off a green screen can create a green edge to foreground elements as well as a general tint to the foreground, or fill image. This is called color spill and flare. The 'chroma correction' settings let you improve the areas of the foreground that are affected by color spill and flare.

Spill

Adjust the spill slider to remove colored tint from the edges of foreground elements. For example, green reflections bouncing off a green screen.

Flare Suppression

Flare suppression removes overall green tint evenly across all foreground elements.

Matching your foreground and background

Once your foreground is properly separated from your green screen, and you have adjusted spill and flare suppression, use the 'color adjustments' controls to match your foreground with the background. Adjusting the brightness, contrast, saturation, and color balance of your foreground image will help blend it with the background so the effect is more convincing.

Use the color adjustments controls to match your foreground with the background

TIP When your key is on air, chroma sampling and preview are locked. While most controls are adjustable while on air, we recommend avoiding changes unless absolutely required. For example making defined color adjustments if conditions change unexpectedly.

Pattern Key

A pattern key is used to display a geometric cut out of one image on top of another image. In a pattern key the key or cut signal is generated using the switcher's internal pattern generator. The internal pattern generator can create 18 shapes that can be sized and positioned to produce the desired key signal.

Combining a background with a fill and pattern key

Background

A full screen image.

Fill

Another full screen image you wish to overlay on top of the background.

Key/Cut

In the case of a pattern key the key/cut signal is generated by the switcher's internal pattern generator.

Pattern Key Settings

To set up a pattern key on the upstream keyer in ATEM Software Control:

- 1 Expand the upstream key palette and select pattern from the key types bar.
- 2 Select the fill source.
- 3 Select the key pattern.
- 4 Adjust the key parameters to refine the key. For a description of pattern key parameters, refer to the table below.

Pattern key parameters:

Invert Pattern	This button inverts which the region is filled with the fill source. For example, fill a region outside of a circle by positioning the circle wipe as desired and then setting invert pattern to 'on'.
Size	Increases and decreases the size of the selected pattern.
Symmetry	Some patterns may have their symmetry or aspect ratio adjusted. Circle patterns may be adjusted to become horizontal or vertical ellipses.
Softness	Changes the softness of the edge of the key signal.
Position X and Y	These settings let you change the position of the pattern on the screen.
Mask	Allows you to mask out sections of the key. For example, if the green screen does not fill the edges of the screen, you can use the mask setting to select only the area of the screen you want to use. To return the mask to its default symmetrical settings, select 'reset mask' and press the set button.

Setting up a Pattern Key on the Upstream Keyer using ATEM 1 M/E Advanced Panel

- 1 Press the KEY 1 next transition button to enable the key on the preview output. This automatically selects the keyers menu on the system control LCD. Pressing the KEY 1 next transition button ties the key to the next transition so it will transition to air when the next transition is performed.
- 2 In the keyers LCD menu, select the 'pattern' key type using the corresponding 'key type' control knob.
- 3 Select the fill source using the corresponding soft control knob or by pressing a source button on the source select bus.
- 4 Turn the corresponding soft control knobs to choose the 'pattern' you want for the pattern key and set the 'size' of the pattern.
- 5 Press the system control left and right arrow buttons to navigate through the pattern key parameters, and adjust settings using the control knobs. Watch the preview output as you refine the key.

TIP Some patterns can have their center point repositioned. Use the joystick to move the position of the pattern. If you need to reset the position, navigate to the 'pattern type' setting, change it to another pattern, and then return to your chosen pattern to rest the position to its default.

DVE Key

DVEs, or digital video effects, are used to create picture-in-picture boxes with borders. ATEM Mini has 1 channel of 2D DVE that allows scaling, rotation, borders and offers a drop shadow.

Combining a background, DVE fill and DVE key/cut

Background

A full screen image.

Fill

Another full screen that has been scaled, rotated or has added borders and will be overlaid on top of the background.

Key/Cut

In the case of a DVE key, the key/cut signal is generated by the switcher's internal DVE processor.

To set up a DVE key on the upstream keyer in ATEM Software Control:

- 1 Expand the upstream key palette and select the DVE tab.
- 2 Select the fill source.
- 3 Adjust the key parameters to refine the key. For a description of DVE key parameters, refer to the information below.

Adjusting the x/y position of the DVE

You can independently adjust the x and y positions of the DVE using the position X and Y settings, or you can tie X and Y parameters together so adjusting one will automatically adjust the other. To achieve this, simply enable the 'tie X and Y' setting.

This also applies to the size parameters.

DVE parameters

Size X	Adjusts the horizontal size of the DVE.
Size Y	Adjusts the vertical size of the DVE.
Reset DVE	Resets the DVE to screen. Useful if you lose track of the DVE during adjustment.

Adding DVE Borders

DVE border parameters

The upstream key LCD menu is used to adjust the border parameters for the DVE and picture in picture.

Border	Enables or disables the border.
Color	This item appears greyed out because it is not a setting, but rather an indicator to show you the selected border color. You can use this indicator to quickly verify the color of the DVE border.
Hue	Changes the border color. The hue value is a location on the color wheel.
Saturation	Changes the intensity of the border color.
Luminance	Change the brightness of the border color.
Style	Sets the bevel style for the DVE border.
Outer Width	Adjusts the outside width of the border.
Inner Width	Adjusts the inside width of the border.
Outer Soften	Outside softness adjusts the outside edge of the border, the edge that touches the background video.
Inner Soften	Adjusts inside softness. This softness parameter adjusts the inside edge of the border, the edge that touches the video.
Border/Shadow Opacity	Opacity adjusts the transparency of the border and shadow, use this setting to create interesting colored glass borders.
Bevel Position	Adjusts the position of the 3D bevel on the border.
Bevel Soften	Bevel softness adjusts the overall softness of the 3D border. A high value for this parameter will result in a rounded or beveled border.

DVE shadow light source parameters

Enable Shadow	Enables or disables the drop shadow.
Angle	Adjusts the direction of the light source on the DVE or picture in picture. Both the border and drop shadow, if available, are affected by changes to this setting.
Altitude	Adjusts the distance of the light source from the DVE or picture in picture. Both the border and drop shadow, if available, are affected by changes to this setting.

Setting up a DVE Key on the Upstream Keyer using ATEM 1 M/E Advanced Panel

- 1 Press the KEY 1 next transition button to enable the keyer on the preview output.
- 2 In the keyers LCD menu, select the DVE key type using the corresponding soft control knob.
- 3 Select the fill source using the corresponding control knob or via the a source button on the source select bus.
- 4 Press the system control left and right arrow buttons to navigate through the DVE parameters, and use the soft control knobs to adjust settings, such as rotation, position, size, mask settings, light source, border, and key frames for movement.

Key Masking

Both upstream and downstream keyers have an adjustable rectangular mask that can be used to crop out harsh edges and other artifacts in the video signal. The mask consists of left, right, top and bottom crop controls. Masking can also be used as a creative tool to build rectangular cut outs on screen.

The mask can be adjusted using the mask settings in the switcher's LCD menu, or via the upstream and downstream keyer palettes in ATEM Software Control.

Flying Key

Luma, chroma and pattern upstream key types include a flying key setting. If a DVE channel is available the flying key setting allows DVE effects to be applied to the key.

Performing Upstream Keyer Transitions

Performing an upstream keyer transition in ATEM Software Control:

The upstream keyer is taken on and off the program output using the 'next transition' control buttons in ATEM Software Control.

Key 1

Take the upstream keyer on or off the program output by clicking the 'on air' button. You will notice this is also reflected by the 'key' button on ATEM Mini's control panel.

Changing the 'on air' setting in the LCD menu also changes the state of the 'on air' next transition button in ATEM Software Control

Upstream Key Example

Example 1

In this example the upstream keyer is not currently on air. The next transition is set to 'on', therefore the next transition will change the state of the key and turn it on so that it is visible on the program output. On ATEM Software Control, the corresponding KEY 1 next transition button will also illuminate.

Example 2

In this example, the key is currently on air, indicated by the 'key' setting set to 'on air'. The next transition setting is also selected, therefore the next transition will change the state of the key and turn it off so that it is not visible on the program output.

Example 3

In this example, the key is on air, indicated by the software control panel's illuminated ON AIR next transition button. The BKGD and KEY 1 next transition buttons are also illuminated, therefore the background and the upstream key are tied to the next transition. The next transition will transition the background and change the state of the key turning it off so that it is not visible on the program output.

There are multiple ways to transition a key to the program output. The key can be cut on or off, it can be mixed on or off, or it can be mixed along with a background transition. Upstream keys are transitioned to the program output using the next transition controls. Downstream keyers can be transitioned using their own transition buttons or by using the DSK TIE buttons to link the transition with the main transition.

DSK parameters

Tie	Switches the DSK TIE button for the respective keyer on or off.
Rate	The mix rate at which the downstream keyer transitions on or off.
Key	Switches the respective DSK CUT button on or off.
Auto	Enables the respective DSK AUTO button to transition the keyer on air.
Fill Source	Selects the source to be keyed.
Key Source	Selects the cut source which masks the fill source.
Pre Multiplied Key	Identifies the key signal as a pre-multiplied key.
Clip	The clip level adjusts the threshold at which the key cuts its hole. Decreasing the clip level reveals more of the background. If the background video is completely black then the clip value is too high.
Gain	The gain adjustment electronically modifies the angle between on and off thereby softening the edges of the key. Adjust the gain value until the edge softness is desirable but the background video luminance, or brightness, is not affected.
Invert Key	Inverts the key signal.
Mask	Allows you to mask out sections of the key. For example, if you need to select only a specific section of a graphic, you can use the mask setting to select only the area of the graphic you want to use. To return the mask to the default settings, select 'reset mask' and press the set button.

HyperDeck Control

Introducing HyperDeck Control

When ATEM Mini is connected to a network via Ethernet, you can also connect up to 4 Blackmagic HyperDeck Studio Mini disk recorders and control them using the HyperDecks palette in ATEM Software Control. They can also be controlled from the system control buttons on an external ATEM hardware panel. This is a very powerful feature! With four HyperDecks connected to your switcher, it's like having a portable videotape department able to record outputs from your switcher, play back graphics, or you can even set your switcher to roll prerecorded segments at the press of a button!

Transport controls are located in the HyperDecks palette in ATEM Software Control, or in the system control menu on an external ATEM hardware panel, which let you play back video, jog and shuttle, skip clips, pause and more. You can also record video.

When you combine this feature with ATEM's powerful macros feature, it opens up a world of creative possibilities that can really enhance your live production!

Connecting HyperDecks

Connecting Blackmagic HyperDecks to your ATEM Mini is very similar to connecting cameras and other video sources via your switcher's HDMI inputs. The only additional connection is Ethernet which lets your ATEM Mini communicate with the HyperDeck disk recorder.

- 1 Using the Ethernet connector, connect your HyperDeck disk recorder to the same network your ATEM Mini is connected to.
- 2 Enable remote control on HyperDeck Studio Mini by setting the 'remote' setting to 'on' using the LCD menu.

Plug the HDMI output of a HyperDeck Studio Mini into one of your ATEM Mini's HDMI inputs

- 3 Plug the HDMI output of your HyperDeck into one of the HDMI inputs of your ATEM Mini.
- 4 Repeat the process for each HyperDeck you want to connect.

Now all you have to do is tell ATEM Software Control or ATEM hardware panel which input and IP address each HyperDeck is using. You can do this easily in the HyperDeck tab in ATEM Software Control switcher settings, or using the system control soft buttons or LCD menu on an ATEM hardware panel.

TIP If you want to record the output from your ATEM Mini to a HyperDeck, plug your switcher's HDMI output into the HDMI input of the HyperDeck. Don't forget to route the program output to the HDMI output.

If your HyperDeck only has an SDI input, for example HyperDeck Studio Mini, you can convert ATEM Mini's HDMI output to SDI using a Blackmagic HDMI to SDI converter, such as a Mini Converter HDMI to SDI, or Teranex Mini HDMI to SDI.

HyperDeck Settings

HyperDeck connection settings are located in the 'HyperDeck' tab of the ATEM Software Control switcher settings. Here you'll see setup options for up to four HyperDecks.

Type in your HyperDeck's IP address in the 'IP Address' box and choosing the source it's plugged into from the 'input' dropdown menu. Click 'connect' and your HyperDeck is ready to be controlled.

Status indicators appear above and below each HyperDeck icon to let you know the connection status. A green tick means your HyperDeck is connected, in remote and ready to go.

If your HyperDeck is connected and recognized, but does not have its remote button enabled, you will see an indicator letting you know remote is not active.

If your HyperDeck is not recognized, you will see a 'failed to connect' indicator. If you see this indicator, check the HyperDeck's Ethernet port is connected to your network and the IP address is entered correctly.

Auto Roll

You can set a HyperDeck disk recorder to automatically roll video when it is switched to the program output. For example, you can cue a HyperDeck to the point you want your source to begin, then roll the source by pressing its input button on the mix effects program row.

As HyperDecks must buffer a couple of frames before commencing playback, the actual cut will be delayed a preset number of frames to ensure a clean transition. This is just like setting a preroll on a videotape machine. You can adjust the length of this delay by changing the number in the 'offset' box. We've found that five frames usually ensures a clean cut.

If you want to cue to a still frame of video or manually trigger video playback on your HyperDeck, you can also deselect the 'auto roll' feature.

Controlling HyperDecks with ATEM Software Control

To control the HyperDecks connected to your switcher, click the 'media player' tab in the software control panel, and choose the 'HyperDecks' palette.

Here you can choose between each of the HyperDecks connected to your system by clicking one of the four buttons along the top of the panel. These are named according to the labels entered in ATEM settings. Available HyperDecks are shown with white text, while the HyperDeck you are currently controlling is shown in orange.

Choose from up to four HyperDecks by clicking their selection buttons in the HyperDecks palette

In addition to the text color, each HyperDeck's selection button also has a tally indicator.

Green Outline	Indicates a HyperDeck that is currently switched to the preview output.
Red Outline	Indicates a HyperDeck that is currently switched to the program output, meaning it is currently live to air. You may also see one of the following status indicators above the selection buttons for your HyperDecks.
Ready	HyperDeck is set to remote and a disk is inserted. It is ready for playback and recording if space is available.
Record	HyperDeck is currently recording.
No Disk	HyperDeck has no disk inserted.
Local	HyperDeck is not set to 'remote' and cannot currently be controlled by your ATEM switcher.

When you select a HyperDeck, you'll see information about the currently selected clip such as the name and length, as well as time elapsed and time remaining. Below this you'll see the control buttons.

Record	Click on this button to start recording on your HyperDeck. Click again to stop recording.
Previous Clip	Moves to the previous clip in your HyperDeck's media list.
Play	Clicking 'play' once initiates playback, clicking it again stops playback. If you have 'auto roll' enabled in your HyperDeck settings, playback will commence automatically when your HyperDeck is switched to the program output.
Next Clip	Moves to the next clip in your HyperDeck's media list.
Loop	Click 'loop' once to loop the currently selected clip, and again to loop all of the clips in your HyperDeck's media list.

To move through a clip use the shuttle/jog slider underneath your HyperDeck's control buttons. This lets you move quickly, or shuttle through a selected clip, or jog frame by frame. You can switch between these modes with the buttons next to the shuttle/jog slider.

Choose between shuttle and jog transport controls with the buttons to the left of the transport slider. Adjust the slider left and right to move forward or backwards through your clip.

The clip list below the transport control shows all of the clips currently available on the selected HyperDeck. You can expand or collapse the list by pressing the arrow to the right of the clip list.

Playback

To play media on your HyperDeck, simply switch the HyperDeck source to the preview output and select the clip you want to show. Use the transport controls to cue to the preferred point in your clip. When you switch your HyperDeck to program output, the 'auto roll' feature will automatically start playback from this point.

If you want to manually trigger the playback, for example holding on a still frame then rolling, simply disable the respective HyperDeck's auto roll checkbox in the 'HyperDeck' tab in ATEM software's 'settings' menu.

Recording

To record to a HyperDeck with a formatted disk inserted, simply press the 'record' button in the HyperDeck palette transport controls. The 'time remaining' indicator in the HyperDeck palette will let you know the approximate recording time remaining in the SSD.

Controlling HyperDecks with External Hardware Panels

If you are using an external ATEM hardware panel, you can control any connected HyperDecks using the hardware panel. Once you have connected your HyperDecks to your ATEM Mini as described in the 'connecting HyperDecks' section, you can use the system control buttons and LED menu on your panel to set up and control each HyperDeck.

HyperDeck Setup with ATEM 1 M/E Advanced Panel

Once you have connected your HyperDeck to your switcher, as detailed in the 'connecting HyperDecks' section, use ATEM 1 M/E Advanced Panel's system control and LCD soft buttons to setup and control your HyperDecks.

To begin, press the system control 'settings' button.

You'll notice that ATEM 1 M/E Advanced Panel displays four setup options along to top of the LCD screen. These include 'switcher,' 'panel,' 'HyperDecks,' and 'button mapping.' Each corresponds to a setup menu. Simply press the LCD soft button above 'HyperDecks' to enter the 'HyperDeck settings' menu.

The HyperDeck settings menu has three pages, which you can select using the 'left' and 'right' arrow buttons in the system control panel, or by pressing the '1,' '2,' and '3' buttons on your ATEM 1 M/E Advanced Panel's numerical keypad.

Assigning an input to a HyperDeck

In the first menu page, you'll see the 'HyperDeck' indicator in the bottom left corner, and an 'input' indicator.

Use the control knob under the 'HyperDeck' indicator to cycle through the available HyperDecks.

Once you have selected a HyperDeck, simply rotate the knob under the 'input' indicator to select which input that HyperDeck is connected to on your switcher. For example, if HyperDeck 1 is connected to input 4 on your switcher, rotate the knob under the 'input' indicator to select 'camera 4.' Press the 'input' knob to confirm your selection.

Repeat this process for any additional HyperDecks you have connected to your switcher by assigning inputs to HyperDeck slots 1, 2, 3 and 4, if required.

Assigning an IP Address

Once you've assigned an input to a HyperDeck, you'll need to enter its IP address. This allows ATEM 1 M/E Advanced Panel to control the HyperDeck via Ethernet.

To enter a HyperDeck's IP address, navigate to the third HyperDeck settings page with the 'left' or 'right' arrow buttons, or pressing '3' on the numeric keypad while in the HyperDeck settings menu.

In this page, you'll see an IP address for the currently selected HyperDeck. Each IP address number corresponds to a rotary knob below it. To change these numbers, you can rotate the corresponding knob, or press the knob once and enter a number using the numeric keypad. Do this for each number in the IP address.

Once you've entered the IP address for your HyperDeck, press the soft button corresponding to the 'save changes' indicator to confirm the address. To cancel, press 'undo'.

To enter the IP address for subsequent HyperDecks, you'll need to select the HyperDeck using the first page of the HyperDeck settings menu.

Auto Roll

You can toggle your HyperDeck's auto roll function from the second screen of the HyperDeck settings menu. While in the HyperDeck settings menu, use the 'left' or 'right' arrow buttons in the system control panel to navigate to this screen.

While in this menu, press the LCD soft button above the 'auto roll' indicator to turn the auto roll feature on. The indicator text will illuminate blue when auto roll is on.

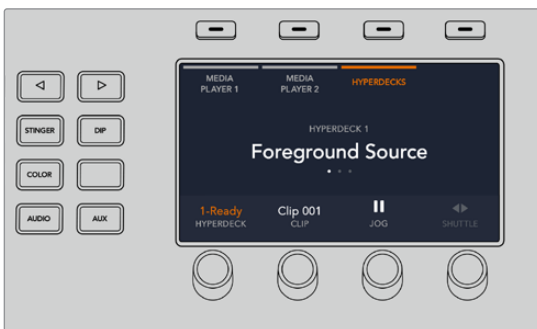

The auto roll feature lets you set a HyperDeck disk recorder to automatically roll video when it is switched to the program output. For example, you can cue a HyperDeck to the point you want your source to begin, then roll the clip by pressing the HyperDeck's input button on the program row.

As HyperDecks must buffer a couple of frames before commencing playback, the actual cut will be delayed a preset number of frames to ensure a clean transition. This is just like setting a preroll on a videotape machine. You can adjust the length of this delay by changing the 'offset' frames number using the control knob under this indicator. Press the soft button above the 'save changes' indicator to confirm your change.

Controlling HyperDecks with ATEM 1 M/E Advanced Panel

HyperDeck controls are available in the 'media players' menu in your ATEM 1 M/E Advanced Panel. To access this menu, simply press the 'media players' control panel button and press the soft button above the 'HyperDecks' indicator to access HyperDeck control. If your switcher has more than two media players, you may need to navigate to the next menu page to access HyperDeck controls.

You can now use the rotating knobs below the 'hyperdeck,' 'clip,' 'jog' and 'shuttle' indicators to select HyperDecks, select clips, and jog and shuttle these clips.

The text in the center of the HyperDeck control menu will change to reflect the HyperDeck and clip that you have selected.

Use the third and fourth pages of the 'media players' LCD menu for more HyperDeck controls, including play, stop, loop playback, and forward and reverse skip for moving between clips.

In the fourth menu page, press the 'record' button to record the program output of your switcher to your HyperDeck. Use the 'jog' and 'shuttle' commands to scrub through recorded footage.

TIP To play all clips, hold down the shift button and press the 'play' soft button.

Connecting ATEM 1 M/E Advanced Panel

ATEM Mini is designed to be controlled using its own built in control panel, but if you have a larger production that is more complex and have many sources, graphics and intricate keys to handle, or you need to operate your ATEM Mini from a separate location, an ATEM 1 M/E Advanced Panel can help you.

ATEM 1 M/E Advanced Panel

The ATEM 1 M/E Advanced Panel is designed for switchers with one mix effects panel, but has the ability to control up to 4 M/Es if you decide to expand your production. The control panel provides high quality buttons for fast, comprehensive control over your switcher, plus CCU control. System control is fast and convenient using a centralized LCD menu with soft buttons and controls. When using ATEM 1 M/E Advanced Panel and the software panel together, any change on one panel will be reflected on the other and you can use both panels at the same time.

ATEM 1 M/E Advanced Panel connects directly to your ATEM Mini via Ethernet and is programmed with a default fixed switcher IP address that works with your ATEM Mini. Once plugged in, the panel will instantly recognize ATEM Mini and you can then switch sources and control your ATEM Mini via the external panel.

NOTE When plugged in directly to ATEM Mini Pro, the panel works using a fixed IP address, but you can also plug into a network and control the switcher from a completely different location. To read more about controlling an ATEM Mini switcher using a network, refer to the 'connecting to a network' section.

To connect ATEM 1 M/E Advanced Panel to your ATEM Mini, simply connect ATEM Mini's Ethernet port to your ATEM 1 M/E Advanced Panel's Ethernet port using a standard CAT5 network cable.

Using ATEM 1 M/E Advanced Panel

ATEM 1 M/E Advanced Panel

Using the Control Panel

Mix Effects

The program bus, preview bus and source names display are used together to switch sources on the program and preview outputs.

ATEM Mix Effects

Source Name Displays

The source name displays use labels to represent the switcher's external inputs or internal sources. Labels for the external inputs can be edited on the settings window of the software control panel. Labels for the internal sources are fixed and don't need to be changed.

The displays show the labels for each row of buttons in the source select row, program row, and preview row.

Pressing the SHIFT button will change the source names display to show extra sources, called shifted sources, allowing selection of up to 20 different sources.

Simultaneously pressing both SHIFT buttons next to the source select and program rows will change the source names display to show protected sources, and these are available in the source select row for keyers and routing to auxiliary outputs. Protected sources are program, preview, clean feed 1 and clean feed 2.

Program Bus

The program bus is used to hot switch background sources to the program output. The source currently on air is indicated by a button that is illuminated red. A blinking red button indicates that the shifted source is on air. Pressing the SHIFT button will display the shifted source.

Preview Bus

The preview bus is used to select a source on the preview output. This source is sent to program when the next transition occurs. The selected source is indicated by a button that is illuminated green. A blinking green button indicates that a shifted source is on preview. Pressing the SHIFT button will display the shifted source.

SHIFT

The SHIFT button provides a global shift and is used to shift the program, preview, and select busses along with the label. It also provides a shift for the transition type and joystick and other menu functions.

Double-pressing buttons in the preview and select busses, as well as the transition type buttons, is the same as shift-selecting them and can be a faster way to shift-select buttons. Double-pressing is not implemented for the program bus as it would cause the program output to momentarily show the wrong source.

Source Select Bus

The source select bus works in conjunction with the source names display and is used to assign sources to auxiliary outputs and keys. When the macro button is enabled, this row of buttons is also used for loading and running macros recorded to the corresponding slots. The buttons will illuminate blue when the macro button is enabled.

The destination display and select bus together show you the routing of sources to keys and auxiliary outputs. The currently selected source is indicated by an illuminated button. A blinking button indicates a shifted source. A green illuminated button identifies a protected source. Protected sources are program, preview, clean feed 1 and clean feed 2.

Transition Control and Upstream Keyers

Transition Control and Upstream Keyers

CUT

The CUT button performs an immediate transition of the Program and Preview outputs, regardless of the selected transition type.

AUTO

The AUTO button will perform the selected transition at the rate specified in the auto rate setting located in the LCD 'home' menu. The transition rate for each transition type is set in the LCD menu, and is displayed when the corresponding transition style button is selected.

The AUTO button illuminates red for the duration of the transition and the fader bar indicator illuminates with sequential LEDs to indicate the progress of the transition. If the software control panel is active, the virtual fader bar also updates to provide visual feedback on the progress of the transition.

Fader Bar and Fader Bar Indicator

The fader bar is used as an alternative to the AUTO button and allows the operator to manually control the transition. The fader bar Indicator next to the fader bar provides visual feedback on the progress of the transition.

The AUTO button illuminates red for the duration of the transition and the fader bar indicator updates to indicate the progress of the transition. If the software control panel is active, the virtual fader bar updates simultaneously.

Transition Type Buttons

The transition type buttons allow the operator to select one of five types of transitions; mix, wipe, dip, DVE, and stinger, labelled STING. Transition types are selected by pressing the appropriately labeled transition type button. The button will illuminate when selected.

When a transition type is selected, the LCD menu shows the transition rate and provides instant access to all the corresponding settings for that transition type. Use the soft buttons and knobs to navigate through the settings and make changes.

The button marked ARM is currently disabled and will be enabled in a future update.

PREV TRANS

The PREV TRANS button enables the preview transition mode allowing the operator to verify a transition by performing it on the preview output using the fader bar. Once you press this button the preview transition feature is enabled and you can preview your transition as many times as you like. This lets you test the transition before going to air and make changes and corrections as needed. You can even preview stinger transitions! Once adjusted, press the button again to disable the feature and you are ready to send your transition on air.

Next Transition

The BKGD, KEY 1, KEY 2, KEY 3, KEY 4 buttons are used to select the elements which will transition on air or off air with the next transition. Any combination of background and keys can be selected by pressing multiple buttons simultaneously. Double pressing the BKGD button selects all of the next transition upstream keyers that are currently on air and copies them to the Next Transition buttons.

Pressing any of the next transition buttons will clear selection of all others. When selecting the elements of the next transition, the switcher operator should look at the preview output because it provides an accurate representation of what the program output will look like after the transition is completed. When only the BKGD button is selected, a transition from the current source on the program bus to the source selected on the preview bus will occur.

Transition Control and Upstream Keyers

ON AIR

The ON AIR indicator buttons above each keyer are labelled ON and indicate which of the upstream keys are currently on air. These can also be used to immediately cut a key on or off air.

MACRO

The macro button is used to enable the macro feature which changes the source select row of buttons to macro buttons corresponding to macro slots.

TIP There are ten macro buttons in the source select row, so if you have macros recorded to slots greater than ten, you can access these by opening the macro settings in the LCD menu and changing the macro group using the control knob.

For more information on how to record and run macros using the advanced panel, refer to 'recording Macros using ATEM 1 M/E Advanced Panel' later in this section.

Downstream Keyers

DSK TIE

The DSK TIE button will enable the DSK on the preview output, along with the next transition effects, and tie it to the main transition control so that the DSK can be taken to air with the next transition.

Because the tied downstream keyer is now tied to the main transition, the transition will happen at the rate specified in the auto rate setting in the LCD 'home' menu. When the DSK is tied, the signal routing to the clean feed 1 is unaffected.

DSK CUT

The DSK CUT button is used to cut the DSK on or off air and indicates whether the DSK is currently on or off air. The button is illuminated if the DSK is currently on air.

DSK AUTO

The DSK AUTO button will mix the DSK on or off air at the rate specified in the DSK rate LCD menu setting.

M/E Buttons

As some ATEM switchers have multiple M/Es you can select which one you want to control using the M/E buttons. When an M/E is selected, the LCD menu will change to show the settings that correspond to that M/E panel.

Press the M/E buttons numbered 1 to 4 to select an M/E panel to control

Fade to Black

The FTB button will fade the program output to black at the rate specified in the FTB rate LCD menu setting. Once the program output has been faded to black, the FTB button will flash red until it is pressed again, fading the program output up from black at the same rate. A fade to black cannot be previewed.

Downstream Keyers and Fade to Black

You can also set your switcher to fade audio together with the fade to black by navigating to the FTB LCD menu and setting AFV to 'on'. This sets the switcher to fade the audio to silence at the rate set for the fade to black. If you want audio to remain on during and after the fade to black, set AFV to 'off'.

System Control Menu Buttons

The buttons on the top left side of your panel, combined with the LCD and its four soft buttons are called the system control. When you press a system control button, for example the 'home' button, the LCD will change accordingly to show the relevant controls and settings. Use the soft buttons and knobs above and below the LCD to make changes.

If there are small dot icons on the LCD menu, this means there is more than one page of settings and you can move through the pages by pressing the left and right arrow buttons.

For example, to change the border softness on a wipe transition

- 1 Press the 'wipe' button.
- 2 Press the right arrow button next to the LCD to move to the third page of settings.
- 3 Rotate the control knob under the 'softness' setting to change the softness of the wipe transition border.

If you want to change the direction of the wipe transition

- 1 Press the arrow buttons to navigate back to the first page of wipe transition settings, or simply press the 'wipe' button to return to the first page.
- 2 Press the 'reverse direction' soft button at the top of the LCD to change the direction.
- 3 Once you are satisfied with the setting, press the 'home' button to return to the home page.

TIP When changing the border softness, you can visually monitor your adjustments in real time. Simply press the PREV TRANS button and move the fader bar while watching the preview output on the multi view to visually monitor your settings. Remember to press PREV TRANS again to disable the transition preview when you're happy with the settings.

The system control buttons and LCD menu are used to access all the settings for your panel, and you can even set general switcher settings directly from the panel. For example, if you need to change the switcher's video format.

System Control

Joystick and Numeric Keypad

The number pad is used to enter numerical data. For example, the number pad can be used to enter a numerical value for transition duration. When entering data using the number pad, the soft buttons below each parameter are used to apply the entered data to that parameter.

The Joystick is a 3-axis joystick that is used to size and position keys, DVEs and other elements. On larger ATEM switchers with an RS-422 'remote' port, the joystick can also be used to control VISCA PTZ cameras.

Joystick Control

Button Mapping

ATEM software and hardware control panels support button mapping so you can assign your most important sources, especially cameras, to the most accessible buttons in the program and preview rows. Occasional sources can be assigned to less prominent buttons. Button mapping is set independently for each control panel so button mapping set on a software control panel will not affect the button mapping set on a hardware control panel.

ATEM Advanced Panel Button Mapping and Button Brightness Level

To access the button mapping settings, press the 'settings' button to open the general switcher settings LCD menu, then press the 'button mapping' soft button.

Use the control knobs under each LCD setting to select the button you want to map and the input you want to change it to. You can also change the button color and label color that is displayed on the panel if you want to highlight specific sources. For example, you may want to highlight your playback sources a different color so you can instantly identify them on the panel. The button will illuminate on both the preview and program rows until the source is switched to the preview or program output, where it will change to green or red respectively.

Once you have changed the setting, the change is made instantly and you don't have to worry about saving. Simply press the 'home' button to return to the home menu.

If you want to change the brightness of the buttons, press the 'settings' button to open the general switcher settings LCD menu, then press the 'panel' soft button to reveal the panel settings.

Rotate the settings knob under each setting until you see the desired brightness level.

Once you have configured all the button settings, press the 'home' button to return to the home menu.

Performing Transitions using ATEM 1 M/E Advanced Panel

ATEM 1 M/E Advanced Panel shares the same control panel layout as the software control panel, plus a large LCD with soft control knobs and buttons which lets you adjust settings dynamically as you control your switcher. This is a fast and convenient way of working with your panel.

This section describes how to perform the various transition types on your switcher using an external ATEM 1 M/E Advanced Panel.

Cut Transitions

The cut is the most basic transition that can be performed on the switcher. In a cut transition the program output is immediately changed from one source to another.

Program output for a cut transition.

A cut transition can be performed directly from the program bus, or using the CUT button in the transition control block.

Program Bus

When a cut transition is performed from the program bus, only the background will be changed, and all upstream and downstream keys will maintain their current state.

To perform a cut transition from the program bus

On the program bus, select the video source that you want on the program output. The program output will immediately change to the new source.

Press any of the source buttons on the program row to perform a cut transition from the program bus

CUT Button

When a cut transition is performed using the CUT button, any upstream keys that were selected in the next transition and any downstream keys that were tied to the transition control will also change state. For example, a downstream key tied to the transition control will cut ON if off air, or cut OFF if on air. Similarly, any upstream keys selected in the next transition will be cut on if they were off air, or cut off if they were on air.

Press the button marked CUT in the transition control block to perform a cut transition

To perform a cut transition using the CUT button

- 1 On the preview bus, select the video source that you want on the program output. The program output will remain unchanged.
- 2 In the transition control block, press the CUT button. The sources selected on the program and preview buses are exchanged to indicate that the video source that was on preview is now on program and vice versa.

TIP We recommend using the transition control block to perform transitions because it provides the opportunity to verify the video content on the preview output before sending it to the program output, for example to verify that a camera is in focus.

Auto Transitions

An auto transition allows you to automatically transition between program and preview sources at a predetermined rate. Any upstream keys that were selected in the next transition and any downstream keys that were tied to the transition control will also change state. Auto transitions are performed using the auto button in the transition control block. Mix, dip, wipe, DVE and stinger transitions can all be performed as an AUTO transition.

The auto transition button is part of the transition control block

To perform an auto transition

- 1 On the preview bus, select the video source that you want on the program output.
- 2 Select the transition type using the transition type buttons in the transition control block.
- 3 In the system control, set the transition rate and adjust any other parameter for the transition as needed.

TIP On the ATEM 1 M/E Advanced Panel, all transition settings are accessed via the LCD menu.

- 4 Press the AUTO button in the transition control block to initiate the transition.
- 5 During the transition, the red and green buttons on the program and preview buses both turn red to indicate that you are in the middle of a transition. The fader bar indicator displays the position and progress of the transition and the transition rate display updates to indicate the number of frames remaining as the transition progresses.

- At the end of the transition, sources selected on the program and preview buses are exchanged to indicate that the video source that was on preview is now on program and vice versa.

Each transition type has its own independent transition rate allowing you to perform faster transitions by simply selecting the transition type and pressing the AUTO button. The previously used transition rate is remembered for that transition type until it is changed.

A production switcher provides multiple methods of transitioning from one shot to another. Generally, you use a simple cut transition to move from one background source to another. Mix, dip, wipe and DVE transitions allow you to transition between two background sources by gradually phasing out one and phasing in another.

Stinger and Graphic Wipe are special transitions which will be covered in a later section. Mix, dip, wipe and DVE transitions are performed as an auto transition or manual transition using the transition control block.

On the ATEM 1 M/E Advanced Panel the transition types, for example dip, mix and wipe, have their own independent selection button.

Mix Transitions

A mix is a gradual transition from one source to another and is achieved by interpolating gradually between two sources, effectively overlapping the sources for the duration of the effect. The length of the transition or length of the overlap can be adjusted by changing the mix rate.

Program output for a mix transition.

To perform a mix transition on the ATEM 1 M/E Advanced Panel:

- On the preview bus, select the video source that you want on the program output.
- Press the MIX button to select the mix transition type. The LCD menu will automatically display the transition settings.
- In the transition settings, use the corresponding LCD control knob to adjust the mix rate. You can also enter a rate duration using the number pad.
- Perform the transition as an auto transition or manual transition from the transition control block.

Press the 'mix' button and set the transition rate using the LCD menu

Mix Transition Parameters

Rate	The mix transition rate in seconds : frames.
-------------	--

Dip Transitions

A DIP is similar to a mix in that it is a gradual transition that transitions from one source to another. However, a dip transition gradually mixes through a third source, the dip source.

For example, the dip transition can be used for a transition that calls for a white flash or a transition that quickly flashes the sponsor logo. The length of the dip transition and the dip source can both be customized.

Program output for a dip transition.

To perform a dip transition on the ATEM 1 M/E Advanced Panel:

- 1 On the preview bus, select the video source that you want on the program output.
- 2 Press the DIP button to select the dip transition type. The LCD menu will automatically display the transition settings.
- 3 In the transition settings, use the corresponding LCD control knob to adjust the dip rate. You can also enter a rate duration using the number pad. Select a dip source.
- 4 Perform the transition as an auto transition or manual transition from the transition control block.

Press the 'dip' button in the transition control block, then set the dip source and transition rate using the LCD menu

Dip transition parameters

Rate	The dip transition rate in seconds and frames.
Dip Source	The dip source is any video signal in the switcher that will be used as the intermediate picture for the dip transition, usually a color generator or media player.

Wipe Transitions

A wipe is a transition from one source to another and is achieved by replacing the current source by another source with a pattern that forms a shape. For example an expanding circle or diamond.

Program output for a wipe transition.

To perform a wipe transition on the ATEM 1 M/E Advanced Panel:

- 1 On the preview bus, select the video source that you want on the program output.
- 2 Press the WIPE button to select the wipe transition type. The LCD menu will automatically display the transition settings.
- 3 Press the desired wipe pattern button on the control panel.
- 4 In the transition settings, use the corresponding LCD control knobs to adjust the border parameters, the wipe rate, and wipe direction. You can also enter a rate duration and specific setting values using the number pad.
- 5 Use the select bus to select the border source.
- 6 Perform the transition as an auto transition or manual transition from the transition control block.

Press a source button in the source select row to select a source for the wipe border. Hold the shift button down to select a shifted source, such as a color generator or media player.

Press a source button in the source select row to select a source for the wipe border, such as a camera or media player.

Hold the shift button down to select a shifted source, such as color bars or a color generator.

TIP The border source used in a wipe transition can be any source in the switcher. For example, a thick border with the media player as its source can be used for sponsorship or branding.

Wipe transition parameters

Rate	The length of the wipe transition in seconds and frames.
Symmetry	Symmetry can be used to control the aspect ratio of the pattern. For example, adjusting the symmetry will allow you to change a circle into an ellipse. Symmetry can be adjusted using the z axis of the joystick.
Position	If the wipe pattern has positioning then the joystick on the external panel or the x position: and y position: boxes in the transition palette of the software control panel can be used to move the center of the pattern. Moving the joystick dynamically updates the x and y position display in the software control panel.

Normal	The normal direction for closed patterns such as circles, diamonds and boxes is to grow from the center of the screen and progress outward.
Reverse	Reverse changes the progression of closed patterns such as circles, diamonds and boxes so that the pattern closes in from the edges of the screen toward the center.
FlipFlop	When FlipFlop mode is toggled on, the transition changes between normal to reverse every time the transition is executed.
Border	Width of the border.
Soft	The edges of the wipe pattern can be adjusted between sharp and fuzzy by adjusting the softness parameter.

DVE Transitions

Your ATEM switcher includes a powerful digital video effects processor for DVE transitions. A DVE transition displaces the image in various ways to transition from one picture to another. For example, a DVE transition can be used to squeeze the current picture off screen revealing a new video under it.

To perform a DVE transition on the ATEM 1 M/E Advanced Panel:

- 1 On the preview bus, select the video source that you want on the program output.
- 2 Press the DVE transition type button to select the DVE transition. The DVE settings will appear on the LCD menu.

NOTE If the DVE is already being used in an upstream key, the DVE transition type will not be available for selection until the key is taken off air and off next transition. Refer to 'sharing DVE resources' later in this section for more information.

- 3 In the DVE LCD menu, use the soft control knobs and buttons to configure the DVE parameters. For example, select the DVE pattern and movement direction, and adjust the DVE transition rate.
- 4 Perform the transition as an auto or manual transition using the auto button or fader bar.

DVE transition parameters

DVE Rate	The duration of the DVE transition in seconds and frames. Rotate the DVE rate knob to adjust the DVE transition rate. The new rate is immediately displayed in the transition rate window in the transition control block.
Symmetry	Symmetry can be used to control the aspect ratio of the pattern. For example, adjusting the symmetry will allow you to change a circle into an ellipse. Symmetry can be adjusted using the z axis of the joystick.

Position	If the wipe pattern has positioning then the joystick on the external panel or the x position: and y position: boxes in the transition palette of the software control panel can be used to move the center of the pattern. Moving the joystick dynamically updates the x and y position display in the software control panel.
Normal	The normal direction for closed patterns such as circles, diamonds and boxes is to grow from the center of the screen and progress outward.

DVE key parameters

Enable key	Enables/disables the DVE key. The DVE key is enabled when the button is illuminated.
PreMult	Select the DVE key as a pre-multiplied key.
Clip	The clip level adjusts the threshold at which the key cuts its hole. Decreasing the clip level reveals more of the background. If the background video is completely black then the clip value is too low.
Gain	The gain adjustment electronically modifies the angle between on and off thereby softening the edges of the key. Adjust the gain value until the edge softness is desirable but the background video luminance (brightness) is not affected.
Inverse	When the key is not pre-multiplied, inverts the key signal.

Sharing DVE Resources

ATEM features a DVE channel which can be used to perform DVE transitions or used in an upstream keyer. When you select a DVE transition, if the DVE is used elsewhere in the system, the DVE transition type will not be available and a DVE unavailable message will be displayed. In order to use the DVE transition you must free the DVE from where it is currently used. Verify that the upstream keys currently on program or preview are not DVE keys and do not have flying key enabled. To free DVE from the upstream keyer, change the key type to anything other than DVE or disable flying key. The DVE will be released and therefore available for use as a DVE transition.

The logo wipe transition is a popular transition that uses the DVE and moves a graphic across the screen over a background transition. For example, the logo wipe moves a graphic over a horizontal wipe, essentially replacing the wipe border. A logo mix spins the graphic across the screen over a mix transition. Logo transitions are perfect for wiping the station logo or spinning a football across the screen revealing a new background. Logo transitions use a special keyer built into the transition block, leaving all of the upstream and downstream keyers available for compositing the output.

The following section explains how to build and perform logo transitions.

The above image sequence provides an example of the program output for a graphic wipe transition.

Performing a Graphic Transition

To perform a graphic transition on the ATEM 1 M/E Advanced Panel:

- 1 Press the DVE transition type button in the transition control block. The DVE settings menu will appear on the LCD.

If the DVE is already being used in an upstream key, the DVE transition type will not be available for selection until the key is taken off air and off next transition.

Refer to 'sharing DVE resources' later in this section for more information.

- 2 Press the 'effect' soft button in the LCD menu to open the effect settings, and set the effect to a graphic wipe by selecting the graphic wipe icon using the 'effect' soft control knob.

The default direction is left to right, but you can change the direction by selecting 'reverse direction'. You can also enable 'flip flop' which will let the effect move forwards and backwards with each performance of the transition, rather than repeating the same movement direction.

- 3 Press the right arrow in the system control buttons to adjust the key settings. Enable the key, and select the fill and key source. If you need to make adjustments to the key, for example adjusting clip and gain settings, press the right arrow in the system control buttons to access the key parameters.

TIP Typically, for a graphic transition, the source would normally be a graphic loaded in a media player. By default, when you select a media player for the fill source, the key source will automatically select the media player key channel and set pre multiplied key to 'on'. This means a graphic with a key matte embedded in the alpha channel will automatically be selected by the switcher. You can disable pre multiplied key and change the key source if you want to use a separate media file on a different media player, or a different input source.

- 4 Press the auto button to perform the transition as an auto transition, or use the fader bar for a manual transition.

Graphic wipe parameters

Rate	Rate specifies the length of the transition in seconds and frames. The rate can be adjusted using the rate knob or by entering a number on the number pad and pressing the set rate button.
Normal	The normal direction moves the graphic from left to right.
Reverse	Reverse changes the direction so that it moves the graphic from right to left.
FlipFlop	When FlipFlop mode is toggled on, the transition changes between normal and reverse every time the transition is executed. The 'Normal' or 'Reverse' light indicates the direction of the next transition.
Fill Source	The fill signal is the graphic used to move across the top of the transition.
Key Source	The key signal is a grayscale image that defines the region in the graphic that will be removed so that the fill signal can be correctly stacked on top of the wipe.

Graphic wipe images

The graphic wipe feature requires a static graphic that is used as a moving border for a horizontal wipe. This graphic should be a vertical 'banner' type graphic that is no more than 25% of the total screen width.

Graphic wipe screen width requirements

1080p	If the switcher is operating at 1080p then the graphic should be no wider than 1,920 pixels.
720p	If the switcher is operating at 720p then the graphic should be no wider than 320 pixels.

Manual Transitions

Manual transitions let you manually transition between program and preview sources using the fader bar in the transition control block. Mix, dip, wipe and DVE transitions can all be performed as a manual transition.

To perform a manual transition

- 1 On the preview bus, select the video source that you want on the program output.
- 2 Select the transition type using the transition type buttons in the transition control block.
- 3 Manually move the fader bar from one end to the other to execute the transition. The next move on the fader bar will begin a new transition.
- 4 During the transition the red and green buttons on the program and preview buses both turn red to indicate that you are in the middle of a transition. The LED indicator on the fader bar also displays the position and progress of the transition.

TIP You will also see ATEM Software Control mirror the move on the software panel.

- 5 At the end of the transition, sources selected on the program and preview buses are exchanged to indicate that the video source that was on preview is now on program and vice versa.

Recording Macros using ATEM 1 M/E Advanced Panel

You can record and run macros using an ATEM 1 M/E Advanced Panel independently of ATEM Software Control. All actions on the ATEM Software Control switcher page can be performed using your hardware panel. If you need to arrange graphics in the media pool, or adjust camera settings, simply access those settings using ATEM Software Control.

The buttons used to record and run macros on the ATEM 1 M/E Advanced Panel are located in the system control buttons. The names of your macro buttons are displayed in the source select names display.

Follow the steps below to create the 'transitions' macro demonstrated earlier using ATEM Software Control. This time you will create a macro in macro slot 6.

- 1 Press the 'macro' soft button to open the macros LCD menu.
- 2 Using the 'macro' knob under the LCD, select the macro slot you want to record to. For this example, select 'slot 6 - Empty'.
- 3 Press the 'record' soft button at the top of the LCD to start recording. The record icon appears as a red circle. When recording, this icon becomes a red square.

Press the 'record' soft button to start recording your macro

While recording, a red border will appear around the LCD

- 4 Shift select 'color bars' on the program bus. The button will flash indicating it's a shifted source.
- 5 Shift select 'color 1' on the preview bus. If you wish, you can map buttons such as color bars, black and color generators to any of the main 10 buttons of the program and preview bus for easier access. See the 'button mapping' section of this manual for instructions.

- 6 Press the wipe button in transition control to ensure the macro records the wipe transition selection.
- 7 In the 'wipe' LCD menu, set the rate to 2:00 seconds.
- 8 Press the 'auto' button in transition control to perform the wipe transition from color bars to color 1.
- 9 Press the 'macro' button to return to the macro screen.
- 10 To set the macro to wait for 2 seconds before applying the next transition, press the 'add pause' soft button in the LCD menu and set the duration to 2 seconds by rotating the 'seconds' knob. Press the 'confirm' soft button to record the pause.
- 11 Now shift select 'black' on the preview bus , press the 'mix' button in transition control and press the 'auto' transition button. Your ATEM switcher will perform a mix transition to black.
- 12 Press the Macro button to navigate back to the Macro menu, then press the 'stop' soft button to stop recording.

You have just recorded a macro using an ATEM 1 M/E Advanced Panel. The macro will appear as a macro button named 'Macro 6' because it is located in macro slot 6. You can name your macro and add notes by clicking on the 'edit macro' button in ATEM Software Control.

To run the macro, press the macro button to set your panel's source select row to macro mode. The buttons will illuminate blue when in macro mode. Now press the macro 6 button. You can easily see when a macro is running because the macro button will flash green and an orange border appears around the LCD menu.

If your macro was successful, you should see your ATEM switcher mix from color bars to color 1 using a 2 second mix transition, pause for 2 seconds, then perform another 2 second mix transition to black, all by pressing one button on your ATEM 1 M/E Advanced Panel. If you want the macro to loop so it keeps running, press the 'loop' soft button to enable loop. Press again to disable loop.

It's worth frequently testing your macros using different switcher settings to make sure the macro performs all the specific functions you intended and doesn't miss any instructions or produce something unexpected.

If you want to record over a previously recorded macro, or if you made a mistake and want to start recording the macro again, press the record button and confirm the overwrite when prompted

Using ATEM Camera Control Panel

Traditionally, camera control units, or CCUs, have been designed for mounting inside a desk with independent units for each camera. ATEM Camera Control Panel is a portable solution that can be placed on a desk or solid surface with 4 CCUs built in so you can control all four Blackmagic Pocket Cinema Cameras at once.

Powering the Panel

To power your camera control panel, connect power via the IEC power input on the rear panel using a standard IEC power cable. You can also use the 12V DC input if you want to connect external power or redundancy via an external power supply, for example a UPS uninterrupted power supply or external 12V battery.

Connect power via the power input on the rear panel

Connecting the Panel to your Switcher

To connect ATEM Camera Control Panel to your switcher, all you need to do is add the panel into your ATEM Ethernet connection chain.

For example, if you are using an external ATEM hardware panel, such as the ATEM 1 M/E Advanced Panel, remove its Ethernet cable from your computer or network and connect it to one of the camera control panel's Ethernet ports instead. The ATEM hardware panel will then be the middle unit in the chain. Now connect the camera control panel's spare Ethernet port to your computer or network.

If you are using the camera control panel with just your switcher and a computer on a shared network, connect the panel to your switcher, then the spare Ethernet port to your computer.

After connecting the camera control panel to your ATEM equipment, you should see the lights on the panel illuminate and the LCDs on each CCU will display their respectively assigned cameras. The panel is now powered, connected to your switcher and ready to start controlling your cameras!

The connection process is fast because all the network settings for each ATEM unit have a different default IP address when shipped from the factory. This means when you connect them all to each other, their network settings are automatically configured and will work straight away.

However, if you are adding a camera control panel to an already existing system, or you need to manually assign a different IP address to avoid potential conflicts on your network, you can enable DHCP so your panel determines the best IP address, or disable DHCP and set the IP address manually.

NOTE ATEM Mini Pro doesn't have a fixed IP address because it is designed to use the DHCP. When connecting ATEM Mini Pro directly to ATEM Camera Control Panel, we recommend setting a manual IP address.

When connecting to the camera control panel and a network, set ATEM Mini Pro to DHCP. The network server will assign an IP address and you can then set that as the camera control panel's switcher IP address so it can communicate with your switcher. You can read more about this in the following section.

For more information about setting ATEM Mini Pro's network settings refer to the 'connecting to a network' section.

Changing Network Settings

Changing network settings means manually setting the panel's IP address so it can join your network, then entering the switcher's IP address on your panel so the switcher can be identified by your panel. These settings are located in your camera control panel's 'settings' LCD menu.

The home screen is the first menu item you will see on the CCU's LCD. To access the network settings, press the 'settings' soft button.

Press the 'settings' soft button on the LCD home screen to access all the camera control panel's settings

The DHCP setting is the first setting in the sequence of menu pages. Under this setting is a row of small dot icons. As you press the arrow soft button to navigate through the pages of settings, the dot icons will illuminate to show which page you are on. All your camera control panel settings are available via these pages.

To set the camera control panel's IP address:

- 1 If you want the panel to automatically set a compatible IP address, select the DHCP setting by pressing the 'on' soft button.

TIP If you know your network's IP address, you can navigate to the next setting page and check the panel's IP address setting to confirm it has selected an address compatible with your network.

- 2 If you want to set the IP address manually, make sure the DHCP setting is set to 'off', then press the arrow soft button to navigate to the 'panel IP address' setting.
- 3 Rotate the corresponding knobs to change the IP address fields.
- 4 Now press the arrow button to move to the subnet mask and gateway settings and make the necessary changes.
- 5 Once all the subnet mask and gateway number fields are set, press the 'save changes' soft button to confirm your settings.

With your camera control panel's IP address set, the network can now communicate with your panel.

The next step is to assign the switcher's IP address on the camera control panel. By telling your camera control panel your switcher's IP address, the panel can then identify your switcher on the network.

TIP If your switcher is located near the camera control panel, it's helpful to open the network settings menu on the switcher so you can observe your switcher's IP address while entering the IP address number fields on the camera control panel. This is also a good way to cross check your network settings between each unit.

To set the switcher's IP address on your camera control panel:

- 1 Press the arrow soft button to navigate to the 'switcher IP address' setting.
- 2 Using the knobs underneath the LCD, set the numbers for each address field.
- 3 Press 'save changes' to confirm your settings.

Now that your panel has identified the switcher, all the controls on your panel should illuminate. This lets you know the panel is communicating with your switcher and is now able to control your cameras via the program return SDI outputs from the switcher to each camera.

If the lights are not illuminated on your panel, check your network settings and ensure the Ethernet cables are connected correctly.

Camera Control Panel Layout

Each CCU on your camera control panel is exactly the same with the same controls. The menu settings are primarily controlled using the left CCU's LCD and soft buttons.

Each CCU has exactly the same controls.

LCD Menu Settings

Pressing the 'home' soft button returns you to main home screen. From the home screen, you can access all your camera control panel's settings including the network settings, auxiliary for camera control, master black enable and disable settings and the brightness settings for adjusting the lights on the various panel controls. You can also identify the software version installed on your camera control panel and the ATEM switcher your panel is connected to.

The home screen displays features you may need access to at all times, for example selecting the desired camera bank and recalling scene files for all cameras

Camera Banks A and B

When the LCD is set to the home screen, you will see the camera bank setting at the top of the display. This setting displays which bank of cameras you are controlling, which is an important feature when using larger ATEM switchers controlling up to 20 Blackmagic Design cameras.

For example, imagine you are controlling 8 cameras and you want to have a dedicated CCU assigned to each camera. You can assign cameras 1 to 4 for each CCU on bank A, then assign cameras 5 to 8 to each CCU on bank B.

Now when switching your live production, you can press the 'bank' soft button to swap between banks A and B, which lets you instantly access camera control for cameras that have been assigned to dedicated CCUs. This is a faster and more organized way of controlling cameras compared to swapping between multiple cameras on each CCU during production.

Press the bank soft button to cycle between camera banks A and B, or hold the button down to disable or enable camera banks

You can also disable the banks by holding down the bank soft button until the 'bank off' setting appears on the LCD.

Turning the banks off lets you change the CCUs to other cameras when needed, with a defined set of cameras ready on each bank you can access at any time. To enable banks, simply press the bank button again.

The bank setting lets you assign 2 banks of cameras to the four CCUs and then instantly swap between them by pressing the 'bank' soft button

TIP Any camera can be selected on each CCU in both banks. For example, imagine you want to have constant control over camera 1, even after switching to another bank of cameras. All you need to do is make sure one CCU in each bank always has camera 1 selected.

Settings

Pressing the 'settings' button on the home screen opens all settings for your camera control panel. Navigate through the pages of settings by pressing the arrow soft button. The network settings, including DHCP and IP address settings, are the first pages in the sequence. These settings are described in the section that shows how to change network settings when connecting the camera control panel to your ATEM switcher. Keep reading this section for information on the additional settings for your camera control panel.

Auxiliary Select

This setting is important for ATEM switchers that have an auxiliary output.

Master Black

Setting the master black setting to on or off enables or disables the master black control, also known as the pedestal control. This is helpful if you want to lock the pedestal so it cannot be accidentally adjusted during production. The pedestal is controlled by turning the ring wheel on the joystick control knob clockwise or counter clockwise. More information on the joystick control is provided in the following sections.

Brightness

These settings let you adjust the brightness for the buttons, indicators, LEDs and LCDs on your camera control panel. Rotate the corresponding control knobs for each setting clockwise or counter clockwise to brighten or dim the lights.

CCU Panel Controls

The panel controls for each CCU are separated into three general sections. These include:

Scene Files and Camera Settings

Scene files are for storing all the camera parameters for each CCU. Camera settings can be changed such as shutter speed, master gain, white balance and enabling color bars. More information for these settings, plus the relative and absolute mode settings, are described in detail in the following 'controlling cameras' section.

The upper section of each CCU is used to store and recall scene files, plus control camera settings such as shutter speed, master gain, white balance and color bars

Color Balance Controls

The red, green and blue color balance knobs in the panel's mid section are for adjusting the color balance of the lift, gamma and gain levels. The white controls are for adjusting the RGB values for the gain, or highlights and the black controls are for

adjusting RGB values of the lift, or the shadows. The black/flare button lets you adjust the RGB values for the gamma, or mid tones, by holding down the button and adjusting the lift RGB knobs.

The color balance controls let you make fine adjustments to the red, green, blue channels for the master gain/white, gamma and pedestal/black levels

There is also a custom control that will be uniquely assignable in a future update. Currently, the custom control knob is set to Y gain control. This increases or decreases the overall luminance, or brightness, of the image. More information about color balance control is provided in the following 'controlling cameras' section.

Lens Controls

The lower section of the panel is where most of the control will occur during production.

The first item you will probably notice is the joystick control. This is used to open and close the iris, also known as the white level or gain control and for adjusting the master black level, also known as the pedestal control.

Gain is adjusted by leaning the joystick forwards or backwards to open or close the iris. Increase or decrease the pedestal by rotating the ring wheel underneath the joystick's knob clockwise or counter clockwise. This gives you fine control over both parameters using the same controller.

The lower section of the CCU is where most of the camera control occurs during live production

Other buttons and knobs in this section of the CCU are for adjusting the sensitivity of the joystick control, setting the coarse level, locking and unlocking the CCU and more. Details on all the features are provided in the following section.

Controlling Cameras

This section describes all the features on each CCU and a general overview on how to approach camera control.

The first step to controlling cameras is to assign a camera for a CCU.

Assigning a Camera to a CCU

At the bottom of the LCD home screen for each CCU, you will see its camera number displayed and a soft control knob underneath it. Simply turn the knob to change the camera number. You will also see the camera name change on the LCD. The camera name will illuminate red when on air.

The camera name and number on the LCD home screen shows the camera currently selected for each CCU

TIP The large camera number next to the CCU's joystick control will also change when you assign a camera. This large identifying number is easy to see and will illuminate red when its camera is live on the program output.

Scene Files

The numbered buttons along the top of each CCU let you quickly store and recall up to 5 scene file presets. For example, once you have arranged all your settings for a camera and you are set up for broadcast, you can then save all the parameters for each camera and recall them later. It's a very fast process!

To store a scene file:

- 1 Press the 'store' button on a CCU. The button will illuminate red to indicate the panel is ready to store a file.
- 2 Press a numbered scene file button.

The scene file indicator and buttons will illuminate, indicating when a scene file is stored or recalled.

To recall a scene file:

Press the numbered button for the scene file you want to recall.

That's all you need to do!

The scene file buttons are used for storing and recalling all settings for CCU controls

Recall All

When this feature is enabled, you can recall a stored scene file on all cameras simultaneously when you press the corresponding scene file button on a single CCU.

For example, you may have a specific setup for each camera that is optimized for a set in your live production. This will likely be a large number of settings that you will want to recall later when you return to that set.

The following is an example of how you can recall complex settings for multiple cameras simultaneously.

To recall a scene file to multiple cameras:

- 1 Once all your cameras are set up, store a scene file for each camera on scene file 1.
- 2 Enable the 'recall all' setting by pressing the corresponding soft button in the LCD home menu.
- 3 Now make any changes you want to each camera.
- 4 Press the scene file 1 button on any CCU. You will notice that all CCUs have recalled the settings stored in scene file 1 for each independent CCU.

NOTE While this feature is very powerful and helpful, please use with care as it affects all cameras, including the camera switched to the program output. We recommend enabling 'recall all' for specific setups prior to air and then immediately disabling the feature until you need it again.

ND

This setting will be enabled in a future update.

CC

This setting will be enabled in a future update.

Master Gain

Blackmagic Design cameras have ISO and gain settings that can be set using the master gain buttons on the camera control panel. To increase the master gain, press the up arrow next to the master gain indicator. To decrease gain, press the down arrow.

Increasing or decreasing the master gain lets you allow for more light in dimly lit shooting conditions, however it's worth being careful with the master gain as electronic noise can appear in the image as it reaches its highest settings.

TIP When a negative gain value is set, the down arrow will illuminate. When positive gain is set, the up arrow will illuminate.

Relative Control and Absolute Control

The camera control panel has two control modes that determine how the panel maintains synchronization between the physical controls and their settings. The two control modes are relative control and absolute control.

Pressing the 'ON' button repeatedly will cycle between relative and absolute control modes

Relative Control

In relative control mode, when a setting is adjusted externally and becomes out of sync with the original controller, the next time a change is made to the original controller, its setting will gradually return to sync as the new adjustment is performed.

For example, if the camera's iris is set to f2.8 on the camera control panel and then set to f5.6 using ATEM Software Control, the joystick will still be physically placed at f2.8, but the setting is now f5.6. In relative mode, when you then adjust the joystick to decrease the gain level, the setting will continue from f5.6 and gently return to sync with the controller as you make changes. The process is almost invisible and it's likely you won't even notice.

Absolute Control

In absolute control mode, the settings are always synchronized to their corresponding controls.

NOTE When the panel is in absolute control mode, it's worth keeping in mind that if a control's setting is changed using ATEM Software Control or a different CCU, the next adjustment on the original controller will result in an initially harsh settings change as it snaps back to its originally set position.

For example, if the joystick has set the iris to f2.8 on the camera control panel and then the setting is changed to f5.6 using ATEM Software Control, the next time you adjust the gain level using the joystick, the gain level will immediately snap to f2.8 and begin adjusting from there. That is because the joystick is still positioned at f2.8 on the camera control panel.

For this reason, it's important to decide before going to air which control mode you want to use when controlling your cameras so you can be sure there is no risk of unintended changes when live to air.

White Balance

You can adjust the white balance of each camera by holding down the white balance button, marked 'W/B' and pressing the shutter up and down arrow buttons to warm or cool the image. The shutter setting indicator displays white balance values so you can monitor the color temperature in degrees Kelvin. Check the white balance setting at any time by holding down the white balance button and observing the shutter setting indicator.

TIP When changing a white balance or shutter speed setting, you can increase their speed of change by holding down the corresponding up or down arrow buttons.

Hold down the W/B button and press the shutter up and down arrow buttons to set a white balance in degrees Kelvin

Color Bars

Pressing the 'bars' button will set the camera to display color bars. Press again to turn bars off.

Shutter Speed

The arrow buttons next to the shutter display let you change the camera's shutter speed. Press the up arrow to increase the shutter speed and down to decrease. For general production use, the shutter speed is typically set to 50, meaning 1/50th of a second, which produces a pleasing motion blur. If you want crisper images with reduced motion blur, for example when shooting sport, a faster shutter speed may be preferred.

Press the shutter up and down buttons to set the camera's shutter speed

White and Black Balance Controls

The two rows of color balance knobs are used to adjust the color balance of the white and black levels, also known as gain and pedestal. Turn the red, green and blue knobs clockwise or counter clockwise to make changes.

TIP For achieving accurate color settings while adjusting the color balance, it's best to view scopes. For example, a waveform, parade or vectorscope as provided on a Blackmagic SmartScope 4K.

Black/Flare Button

Adjust the color of the gamma or mid tones by holding down the black/flare button and adjusting the black balance RGB controls.

D EXT/EXT

This feature will be enabled in a future update.

Camera Number

Each CCU has its own large camera number that shows you which camera is being controlled. This large display is illuminated green when in a neutral state and red when its camera is switched to the program output.

Gain and Pedestal Level Control

The joystick control lets you make fine adjustments to the gain/iris and pedestal/master black levels.

Leaning the joystick forwards or backwards opens or closes the camera's iris, also known as the gain level. As you lean the joystick forwards and backwards, its indicator strip will illuminate, providing an approximate display of the camera's exposure. For a precise assessment of the exposure f-stop, observe the iris indicator.

The joystick lets you adjust the gain level by leaning the controller forwards and backwards. The master black level can be adjusted by turning the ring wheel clockwise or counter clockwise. Corresponding indicators are provided for accurate measurement.

Located around the collar of the joystick's handle is a ring wheel that controls the pedestal level. The ring wheel has small ridges built in for firm control and a position indicator is located on the top of the knob to show the physical positioning of the wheel. Turn the wheel clockwise to increase the master black level, or counter clockwise to decrease.

Iris and Master Black Indicators

The indicators for the iris and master black joystick control displays the gain value, shown as the f-stop exposure level for the camera lens and the level of the master black setting.

Sensitivity

The sensitivity setting lets you define a specific range between the highest and lowest gain levels so you can achieve finer control using the joystick. For example, when sensitivity is at its maximum setting, you can lean the joystick all the way forwards or backwards, however it will only affect a narrow range of gain.

You can define how narrow the range is by increasing or decreasing the sensitivity.

Coarse Control Knob

The coarse setting lets you define a limit to the maximum gain control. For example, you may want to ensure your gain never rises higher than a determined exposure.

To do this:

- 1 Lean the joystick to its highest position to increase the gain setting to its maximum.
- 2 Now decrease the coarse setting by rotating the coarse knob counter clockwise until the gain reaches the limit you want to set.

You can now lean the joystick all the way up and down and the gain will never rise higher than the limit you have set.

TIP When the coarse control is combined with the sensitivity control, you can define an upper and lower limit to the gain control.

For example, imagine you want to limit the gain so it never rises above f4.0 because gain above that level will clip highlights in your image. You also want to limit the gain so its minimum setting will be f8.0 to maintain the optimum sharpness range for your lens.

To do this:

- 1 Increase the gain control to its maximum position by leaning the joystick all the way to its top position.
- 2 Now decrease the coarse setting until it reaches the upper limit you want to set. In this case, f4.0.
- 3 To set the lower limit, lean the joystick all the way to its bottom position.
- 4 Now increase the sensitivity setting until the gain reaches the lower limit you want to set. In this case, f8.0.

Now you can lean the joystick all the way from top to bottom and the gain will stay within the limits you have set. This is a powerful way to define your exposure limits, plus gain finer control with the joystick due to allowing its maximum travel forwards and backwards.

Iris and Master Black Active

Once your levels are set and you want to lock them so they are not accidentally changed, press the 'iris/MB active' button. This enables a lock on the gain and master black so that any accidental movements of the joystick will not affect your settings. The 'Iris/MB active' button label will illuminate red when the lock is active. To disable the lock, press the button again.

TIP You can lock the black/pedestal level independently by disabling the 'master black' option in the 'settings' menu. When disabling master black, the black level is locked but the iris/gain level can still be adjusted. Don't forget to enable the master black setting if you want to make changes to the black/pedestal level.

Auto Iris

If your camera is using a compatible lens with electronic iris control via the camera, then you can press the 'auto iris' button for a quick automatic exposure setting. The camera will set exposure based on average brightness, providing an average exposure that is a balance between the brightest highlights and the darkest shadows.

Call

Holding down the 'call' button will flash the tally light on the CCU's selected camera when using Blackmagic URSA Broadcast and Blackmagic URSA Mini Pro 4.6K. This is a helpful way of seeking the camera operators' attention, or to let your operators know you are about to go live.

While holding down the call button, the large camera number next to the joystick will also flash so you can visually confirm the call is being sent.

Panel Active

After you are happy with your camera settings, you may want to lock all the controls so they cannot be accidentally adjusted. Pressing the 'panel active' button enables the CCU lock so all controls cannot be changed. Press the button again to disable the CCU lock. This can be a helpful feature when you are recording a locked off shot and don't want the setting adjusted by accident, for example a wide shot of a stadium filling as the crowd enters.

ATEM Camera Control Panel is an exciting, practical and efficient way to control Blackmagic Design cameras in your live production. We believe you will enjoy the experience of hands on camera control using CCUs, which lets you take control of exposure and other camera settings, freeing up your camera operators so they can concentrate on framing and focus.

Using Audio

Connecting other Audio Sources

Your ATEM switcher features 3.5mm jack inputs so you can connect external microphones and audio sources, for example music players.

3.5mm jack inputs let you connect external analog audio, for example microphones and music players

Using Embedded HDMI Audio Sources

Your ATEM Mini includes a built-in audio mixer that lets you use the embedded HDMI audio from your cameras, media servers and other inputs without the need for an external audio mixer.

Once you've connected your HDMI cameras to the switcher for vision mixing, there are no other connections to make as the audio mixer uses the embedded audio in the video signal. This saves space and makes setup very fast and low cost as you don't need separate audio connections for every video source, and you don't need an external audio mixer unless you prefer to use one.

The audio is mixed using the control buttons on your ATEM Mini, or via the Audio tab of ATEM Software Control and output over USB webcam and HDMI outputs as embedded digital audio.

Using a Third Party Audio Mixer Control Surface

Using an Audio Mixer Control Surface

Connecting a hardware audio mixer control surface to your ATEM Mini provides you with the ability to use both hands and adjust multiple audio levels at the same time.

An audio mixer control surface can be connected to your Mac or PC as a MIDI device using Mackie Control commands to communicate with ATEM Mini.

Many third party MIDI control surfaces are compatible with your ATEM Mini but please check with the manufacturer of your control surface if in doubt.

You can adjust multiple audio levels at the same time by connecting a hardware audio mixer to the computer which is running ATEM Software Control

Connecting Your Audio Mixer Control Surface

- 1 Connect your compatible MIDI control surface to your Mac or PC. Most modern control surfaces use USB.
- 2 Verify your control surface is recognized by your computer as a MIDI device.

For Mac OS computers, go to Applications/Utilities/Audio MIDI Setup and launch the application. Go to the Window menu and choose Show MIDI Window. Ensure your control surface appears as a MIDI device in this window.

For Windows computers, go to Computer/Properties/Device Manager/Sound, Video and Game Controllers and ensure your control surface appears in the list of icons.

- 3 The ATEM audio mixer is designed to communicate with your control surface using Mackie Control commands so your control surface will need to support Mackie Control. You'll also need to make sure your control surface is configured to use native Mackie Control or Mackie Control emulation. Please refer to your control surface's user manual for configuration details.

Some control surfaces offer several types of Mackie Control emulation and you should choose the one that activates the most features on your control surface. For example, with the Behringer BCF 2000, choosing "Mackie Control Mapping for Cakewalk Sonar 3 [MCS0]" enables level faders, bank selectors, balance control, AFV and ON/MUTE functions, and also activates the LED screen which displays which bank of faders you have selected for your audio mix. The LED screen will not activate if you choose another Mackie Control emulation.

- 4 Launch ATEM Software Control and it will automatically look for your control surface using the first port on the first MIDI device that it finds. Click on the Audio tab in ATEM Software Control to display the ATEM audio mixer. Try sliding the gain faders up and down on your hardware control surface and verify that the audio mixer faders show a corresponding increase and decrease in the software on your computer screen. If so, you have successfully configured your control surface to work with the ATEM switcher.

TIP If your midi device is not working as expected, ensure 'enable midi control' is selected in ATEM Software Control's general switcher preferences.

Try sliding the gain faders up and down on your hardware control surface and verify that the audio mixer faders show a corresponding movement in the software on your computer screen

The MUTE button

In the ATEM audio mixer interface, audio is always on, or present in the mix, when the ON button is selected. When the ON button is deselected, audio is not present or is muted. To match the software interface, you'll find the MUTE button on your audio mixer control surface will be lit when audio is always on or present in the mix. The MUTE button will be unlit when audio is not present or is muted.

Decibel Scales

All hardware mixers are made differently, and the scale printed on your control surface may not match the scale in the ATEM audio mixer interface. Always refer to the ATEM audio mixer levels for the true decibel scales.

Help

Getting Help

The fastest way to obtain help is to go to the Blackmagic Design online support pages and check the latest support material available for your ATEM Mini.

Blackmagic Design online support pages

The latest manual, software and support notes can be found at the Blackmagic Design support center at www.blackmagicdesign.com/support.

Blackmagic Design Forum

The Blackmagic Design forum on our website is a helpful resource you can visit for more information and creative ideas. This can also be a faster way of getting help as there may already be answers you can find from other experienced users and Blackmagic Design staff which will keep you moving forward. You can visit the forum at <https://forum.blackmagicdesign.com>

Contacting Blackmagic Design support

Alternatively, click on the “Find your local support team” button on the support page and call your nearest Blackmagic Design support office.

Checking the version currently installed

To check which version of ATEM software is installed on your computer, open the About ATEM Software Control window.

- On Mac OS, open ATEM Software Control from the Applications folder. Select About ATEM Software Control from the application menu to reveal the version number.
- On Windows, open ATEM Software Control from your 'start' menu. Click on 'help' in the menu bar and select 'about' to reveal the version number.

How to get the latest updates

After checking the version of ATEM software installed on your computer, please visit the Blackmagic Design support center at www.blackmagicdesign.com/support to check for the latest updates. While it is usually a good idea to run the latest updates, it is a wise practice to avoid updating any software if you are in the middle of an important project.

Regulatory Notices

Disposal of Waste of Electrical and Electronic Equipment Within the European Union.

The symbol on the product indicates that this equipment must not be disposed of with other waste materials. In order to dispose of your waste equipment, it must be handed over to a designated collection point for recycling. The separate collection and recycling of your waste equipment at the time of disposal will help conserve natural resources and ensure that it is recycled in a manner that protects human health and the environment. For more information about where you can drop off your waste equipment for recycling, please contact your local city recycling office or the dealer from whom you purchased the product.

This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to Part 15 of the FCC rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. Operation of this product in a residential area is likely to cause harmful interference, in which case the user will be required to correct the interference at personal expense.

Operation is subject to the following two conditions:

- 1 This device may not cause harmful interference.
- 2 This device must accept any interference received, including interference that may cause undesired operation.

Connection to HDMI interfaces must be made with high quality shielded HDMI cables.

R-R-BMD-201911001

ISED Canada Statement

This device complies with Canadian standards for Class A digital apparatus.

Any modifications or use of this product outside its intended use could void compliance to these standards.

Connection to HDMI interfaces must be made with high quality shielded HDMI cables.

This equipment has been tested for compliance with the intended use in a commercial environment. If the equipment is used in a domestic environment, it may cause radio interference.

Safety Information

This equipment is suitable for use in tropical locations with an ambient temperature of up to 40°C.

Use only at altitudes not more than 2000m above sea level.

No operator serviceable parts inside. Refer servicing to your local Blackmagic Design service centre.

State of California statement

This product can expose you to chemicals such as trace amounts of polybrominated biphenyls within plastic parts, which is known to the state of California to cause cancer and birth defects or other reproductive harm.

For more information go to www.P65Warnings.ca.gov.

Singapore Notice

The power adapter supplied with your Blackmagic Design equipment has interchangeable plugs to suit the mains socket outlets in a number of countries. Each plug marked with the model numbers APD2-UK or APD2-EU are approved and suitable for use in Singapore.

Warranty

12 Month Limited Warranty

Blackmagic Design warrants that this product will be free from defects in materials and workmanship for a period of 12 months from the date of purchase. If a product proves to be defective during this warranty period, Blackmagic Design, at its option, either will repair the defective product without charge for parts and labor, or will provide a replacement in exchange for the defective product.

In order to obtain service under this warranty, you the Customer, must notify Blackmagic Design of the defect before the expiration of the warranty period and make suitable arrangements for the performance of service. The Customer shall be responsible for packaging and shipping the defective product to a designated service center nominated by Blackmagic Design, with shipping charges pre paid. Customer shall be responsible for paying all shipping charges, insurance, duties, taxes, and any other charges for products returned to us for any reason.

This warranty shall not apply to any defect, failure or damage caused by improper use or improper or inadequate maintenance and care. Blackmagic Design shall not be obligated to furnish service under this warranty: a) to repair damage resulting from attempts by personnel other than Blackmagic Design representatives to install, repair or service the product, b) to repair damage resulting from improper use or connection to incompatible equipment, c) to repair any damage or malfunction caused by the use of non Blackmagic Design parts or supplies, or d) to service a product that has been modified or integrated with other products when the effect of such a modification or integration increases the time or difficulty of servicing the product. THIS WARRANTY IS GIVEN BY BLACKMAGIC DESIGN IN LIEU OF ANY OTHER WARRANTIES, EXPRESS OR IMPLIED. BLACKMAGIC DESIGN AND ITS VENDORS DISCLAIM ANY IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE. BLACKMAGIC DESIGN'S RESPONSIBILITY TO REPAIR OR REPLACE DEFECTIVE PRODUCTS IS THE WHOLE AND EXCLUSIVE REMEDY PROVIDED TO THE CUSTOMER FOR ANY INDIRECT, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES IRRESPECTIVE OF WHETHER BLACKMAGIC DESIGN OR THE VENDOR HAS ADVANCE NOTICE OF THE POSSIBILITY OF SUCH DAMAGES. BLACKMAGIC DESIGN IS NOT LIABLE FOR ANY ILLEGAL USE OF EQUIPMENT BY CUSTOMER. BLACKMAGIC IS NOT LIABLE FOR ANY DAMAGES RESULTING FROM USE OF THIS PRODUCT. USER OPERATES THIS PRODUCT AT OWN RISK.
